T0. Summary

T0.1 National profile

- Domestic drug market

The only drug produced in Ireland is cannabis. However, the market is constantly changing; pre-precursors such as alpha-phenylacetonitrile (APAAN) and benzyl cyanide, and precursors such as piperonyl methyl ketone (PMK) and benzyl methyl ketone (BMK), have been detected in Ireland in the past number of years. Synthetic drugs are not produced in Ireland, nor are general illegal drugs tableted. Ireland is viewed as an end source, not a transit country. Its long coastline acts as a route for drugs to be brought into the United Kingdom (UK) and the rest of Europe. In 2020, law enforcement operations on the island of Ireland carried out by the Revenue Commissioners and An Garda Síochána (AGS) indicated that illegal drugs brought into Ireland originated in Europe (Spain, Italy, the Netherlands, and the UK); Southeast Africa (Mozambique); the United States of America (USA) and Canada. The main modes of transport were by freight via Rosslare Europort and Dublin Port, by plane via Dublin and Shannon Airports, or via the postal system.

- National drug law offences

Information regarding Ireland's drug law offences comes from the Courts Service, the Irish Prison Service (IPS), and AGS data via the Central Statistics Office (CSO). Data provided by the Courts Service and the IPS refer to the total number of drug offences and are not differentiated by drug type. However, AGS data, which differentiate by drug offence type, indicate that the total number of drug offences detected decreased by 9% between 2019 and 2020. By type of drug offence for the supply offences, between 2019 and 2020 incidents for importation of drugs decreased by 25% and incidents for cultivation or manufacture increased by 98%. For possession offences, between 2019 and 2020 there were increases in possession of drugs for sale or supply (26%) and possession of drugs for personal use (2%).

- Key drug supply reduction activities

Ireland is very committed to reducing drug supply, as evidenced by law enforcement responses demonstrated in key actions in the national drugs strategy and in policing plans which have been implemented across the island of Ireland. A multifaceted, multi-agency approach has been drawn upon; this includes collaborative working and information sharing between Irish law enforcement agencies such as AGS, the Revenue Commissioners, the IPS and the Probation Service at a national level; and between cross-border agencies such as the Police Service of Northern Ireland (PSNI) and European and international agencies. Operations have focused on drug interdiction and have targeted organised crime groups (OCGs), gangland crime, and drug-related intimidation; for example, the Garda National Drugs and Organised Crime Bureau (GNDOCB) was established to tackle drugs and organised crime, Operation Tara was implemented to target drug trafficking and Operation Hybrid and Operation Stratus were implemented by AGS to target gangland crime. Agencies have aimed to address reoffending: a new Irish Youth Justice Strategy has been launched, and interventions are being reviewed and strengthened. On the island of Ireland, Garda Youth Diversion Projects for juveniles and youth have been established; child detention schools that have youth advocacy programmes have also been established. The Probation Service prioritises positive behaviour and restorative practice. Intervention and prevention strategies are being strengthened to provide greater early intervention.

T1. National profile

T1.1 Drug market

T.1.1.1. Domestic production

Cannabis

The domestic cultivation of cannabis herb escalated in Ireland in 2007, reaching a peak in 2011. Despite substantial interventions by law enforcement, it continues to be cultivated. The most recent figures available have indicated that 381 incidents of cultivation or manufacture of drugs were recorded in 2020, which was approximately twice that recorded in 2019 (n=192) (see Section T2.3, Figure T2.3.4 in this workbook). This increase is likely the result of the Covid-19 pandemic which has interfered with normal distribution routes (Gallagher 2020, 23 November). In addition, as stated in previous workbooks, there are several reasons for this continued cultivation: first, sophisticated growing techniques are utilised, which result in the flowering tops of the female plant being highly potent (20% tetrahydrocannabinol [THC]), making it more profitable. Second, start-up and running costs are low (Police Service of Northern Ireland and An Garda Síochána 2015), and there is a ready availability of vacant houses because of the 2008 financial crisis (Police Service of Northern Ireland and An Garda Síochána 2018). Third, individuals' avail of advances in technology and communication, as demonstrated by the Windle study detailed in Section T4.1. Other reasons that have emerged and have been reported by the media are that some offenders are growing cannabis to help manage existing medical health conditions (Lucey 2017, 10 March), (Nic Ardghail 2017, 21 November), (Maguire 2017, 9 February), (McLean 2017, 8 February).

Synthetic drugs

As stated in previous Drug markets and crime workbooks, synthetic drugs are not produced in Ireland (personal communication, GNDOCB, 2017). However, the synthetic drug market is continually changing; as highlighted in previous workbooks, pre-precursors (e.g., APAAN, benzyl cyanide) and precursors (e.g., PMK and BMK) which are used in the manufacture of 3,4-methylenedioxymethamphetamine (MDMA) and amphetamine were detected in Ireland in 2013 (An Garda Síochána and Police Service of Northern Ireland 2016). More recently, four separate 'box labs' were detected in Youghal, Co Cork; Tralee, Co Kerry; Lusk, North County Dublin; and in Dublin 8, suggesting that methamphetamine was being produced, albeit on a small scale (An Garda Síochána and Police Service of Northern Ireland 2016). Moreover, in January 2018, a suspected crystal meth lab was discovered in Dublin (McMahon 2018).

Tableting operations

As stated in previous workbooks, tableting of general illegal drugs does not really take place in Ireland (personal communication, GNDOCB, 2017). However, as reported in previous National Reports, there has been some evidence that Irish OCGs have participated in tableting pharmaceutical drugs; for example, drugs such as zopiclone, zolpidem, or benzodiazepines have been obtained in powder form and then used to produce tablets using specialised equipment (personal communication, GNDOCB, 2016). In May 2018, a pill-making factory linked to the Kinahan OCG and run by three male's resident in Ireland but formerly from Eastern Europe was discovered in Celbridge, Co Kildare (An Garda Síochána 2018, 6 May), (Pope C 2018, 6 May). Tableting machines, which have mainly been found in Irish grow houses, tend to be archaic and slow when compared with those that are found elsewhere, for example in the Netherlands. Irish law enforcement agencies do not view the tableting process as chemical drug synthesis because all that occurs is that tablets and binding agents are pressed together (personal communication, GNDOCB, 2017).

T1.1.2 Routes of trafficking

As stated in previous Drug markets and crime workbooks, Ireland's extensive 3000 km coastline leaves it susceptible to traffickers seeking less-guarded routes to bring drugs to the UK and Europe (McDonald and Townsend 2007, 8 July). Identifying the origin of drugs being transported to Ireland can be difficult, as Ireland is primarily an end source and not a transit country (personal communication, GNDOCB, 2017). Nonetheless, the most recent analysis available of cross-border crime and threat assessment published by the PSNI and AGS indicated that drugs originated from, for example, Morocco (cannabis resin), the Netherlands (synthetic and semi-synthetic drugs), Afghanistan via Balkan routes (heroin), China (new psychoactive substances [NPS]), and India and Pakistan (counterfeit medicines) (An Garda Síochána and Police Service of Northern Ireland 2016).

The Revenue Commissioners also continued its engagement at an international level with the World Customs Organization (WCO), Europol, INTERPOL, the European Multidisciplinary Platform Against Criminal Threats (EMPACT), the Irish Embassy in the UK, and the Maritime Analysis and Operation Centre – Narcotics (MAOC-N) in ongoing actions aimed at addressing threats and at intercepting and preventing the trafficking of drugs, illegal medicines, NPS, and drug precursors (Revenue Commissioners 2021).

Additionally, interdictions are carried out independently and collaboratively by Irish law enforcement agencies – such as the Revenue Customs Drug Law Enforcement Unit, AGS, CAB, Defence Forces, the Health Products Regulatory Authority (HPRA), and the Naval Service – at a national and international level can provide useful information on the origin, and, sometimes, the intended destination within Ireland, of drugs being brought into the country (Revenue Commissioners 2021).

Additional information can be gleaned from Revenue Commissioners [press releases](#). In 2020, illegal drugs brought into Ireland originated in places such as Europe (Austria, Spain, Italy, Luxembourg, the Netherlands, Slovakia, and the UK); Southeast Africa (Mozambique); the USA; Canada (Revenue Commissioners, 2021, website). The main modes of transport were by freight via Dublin Port and Rosslare Europort, or by plane via Dublin, Cork, and Shannon airports. Products that arrived by plane were concealed in baggage, metal container and parcels. Another method that was used extensively was the postal system. Several products were intercepted by post in controlled deliveries using detector dogs.

AGS [press releases](#) provides a summary of operations carried out independently and jointly by various AGS units across the island, for example the GNDOCB, the Special Crime Task Force, detective units, traffic divisions, dog units, uniformed community gardaí, and divisional drug units (DDUs). Operations were carried out across the island of Ireland, and the estimated value of products reached up to €7 million. All products that were seized by AGS in offences that were related to the sale and supply of drugs were sent to Forensic Science Ireland (FSI) for analysis, and thus the estimated weight of seized products was only provided for some operations. In 2020, drugs seized were mainly located via house, premises, and vehicle searches, often as part of intelligence-led operations.

T1.1.3 Contextual information on trafficking

As stated in previous Drug markets and crime workbooks, only one study has examined the nature, structure, and organisation of the illegal drug markets in Ireland (Connolly J and Donovan A M 2014). Four local drug markets were included: two urban, one suburban and one rural (anonymised as A–D). Although cannabis was shown to be the main drug supplied, heroin, crack cocaine, and prescription drugs could also be obtained at different levels across all locations surveyed. Further information on this study can be found in *Ireland: national report for 2015 – Drug markets and crime* (Health Research Board and Irish National Focal Point to the European Monitoring Centre for Drugs Drug Addiction 2016). To date, no other study provides contextual

information on drug trafficking in Ireland. However, figures from FSI for 2020 indicated that the most prominent drugs analysed in Ireland were cannabis herb, cocaine, and heroin, followed by alprazolam, MDMA, alprazolam, zopiclone, cannabis plant and cannabis resin (personal communication, FSI, 2021). Table T1.1.5.1 in Section T1.1.5 lists the illegal drugs in Ireland, based on FSI records for 2020 in descending order. Trends for these substances can be found in Section T2.1.

Size of transactions

Estimated transaction sizes vary by product and are reported in Revenue Commissioners press releases. In 2020, where quantities were reported, seizures detained by Revenue Commissioners Officers ranged in size; the highest estimate was €7 million (Revenue Commissioners Press Releases, 2021). AGS press releases rarely report quantities, as the seized product is sent directly to FSI for analysis.

Smuggling methods

In 2020 drugs were smuggled into Ireland via:

- airports – products were transported in two ways: either concealed or in checked-in luggage; or in parcels
- ports – horse box search and shipment searches
- the postal network – drugs were concealed in parcels, declared as sweaters, plastic ornaments, wedding invitations, make-up stand, toys, and plastic ornaments. Some were marked ‘clothing’, ‘gifts’, or ‘eye creams’ and ‘skin primer’.

The common travel area between the Republic of Ireland and Northern Ireland is also vulnerable to criminality via hauliers who, knowingly and sometimes unknowingly, transport drugs between both locations for OCGs (Police Service of Northern Ireland and An Garda Síochána 2018); (National Crime Agency 2018).

Organisation

As stated in previous Drug markets and crime workbooks, the Irish drug market is widely dispersed around the island of Ireland and impacts on urban, suburban, and rural communities (Connolly and Buckley 2016). The main players that profit the most are OCGs of various nationalities; for example, Irish, Chinese, Vietnamese, and Eastern European OCGs profit the most (personal communication, GNDOCB, 2017). However, there is also evidence to suggest that individual entrepreneur networks which started small are now prospering (personal communication, GNDOCB, 2017). Ongoing research by Dr Sean Redmond and colleagues at Limerick University on criminal networks in Ireland has illustrated the existence of a hierarchical criminal network consisting of one individual (A2) and his family, which has had a negative impact on associates, clients, and residents in a suburban estate. Updates on recent studies published by this group can be found in section T4.1 of this workbook.

T1.1.4 Wholesale drug and precursor market

There were no changes to wholesale market prices in 2020 (personal communication, GNDOCB, 2021). Basically, wholesale drug prices depend on two things: one, what quantity is being purchased; and two, the purity of the drug. Table T1.1.4.1 shows the wholesale prices based on average purity of the product in terms of a purchase of one kilogram of a substance. For example, cocaine with a purity of 85% will sell for €60,000, but in reality, on the wholesale market, OCGs already cut and mix the drugs. As a result, cocaine that the GNDOCB detects may be sold for approximately €25,000 per kilogram; the purity at this price will be less than 40%. The premise of ‘the more you buy, the cheaper the price’ applies to all drugs. By way of example, a

purchase of 100 MDMA (ecstasy) tablets could cost €5 per tablet, a purchase of 1,000 could cost €4 per tablet, a purchase of 10,000 could cost €3 per tablet, etc. There is no evidence of wholesale prices for some substances (see substances in Table T1.1.4.1 marked 'NE') (personal communication, GNDOCB, 2018).

Wholesale price data are determined from undercover purchases and covert human intelligence sources, which are gathered using a continuous assessment approach and through consultation with nationwide drug unit supervisors. When the information is available, random samples are taken. There is no deviation from what is requested in the submitted data. Importantly, there is very little evidence regarding wholesale prices for some NPS producers, such as synthetic cannabinoids (personal communication, GNDOCB, 2018).

Table T1.1.4.1 Drug prices based on current wholesale market value of controlled drugs, October 2019

Drug	Category	Price per kilogram/per litre
25I-NBOMe	Hallucinogen	N/A
2C-B	Phenethylamine	€10,000/kg
2C-E	Phenethylamine	€10,000/kg
2C-I	Phenethylamine	€10,000/kg
5AKB48 (not controlled)	Synthetic cannabinoid	NE
Alprazolam	Benzodiazepine	NE
AM-2201	Synthetic cannabinoid	€5,000/kg
Amphetamine	Phenethylamine	€3,000/kg
AMT	Tryptamine	NE
Benzylpiperazine	Piperazine	€10,000/kg
BKMBDB	Cathinone	€10,000/kg
Bromazepam	Benzodiazepine	NE
Butylone	Cathinone	€10,000/kg
Cannabis herb	Cannabis	€8,000/kg
Cannabis plants*	Cannabis	N/A
Cannabis resin	Cannabis	€1,500/kg
Chlordiazepoxide	Benzodiazepine	NE
Clobazam	Benzodiazepine	NE
Clonazepam	Benzodiazepine	NE
Cocaine	Cocaine	€25,000/kg
CPP	Piperazine	€10,000/kg
Diamorphine (heroin)	Opioid	€35,000/kg
Diazepam	Benzodiazepine	N/A
Dimethylone	Cathinone	€10,000/kg
Dimethylamylamine (DMAA)	Phenethylamine	€10,000/kg
DMT	Tryptamine	NE
Ethcathinone	Cathinone	€10,000/kg
Ethylone	Cathinone	€10,000/kg
Flephedrone	Cathinone	€10,000/kg
Flunitrazepam	Benzodiazepine	N/A
Fluoroamphetamine	Phenethylamine	€3,000/kg
Fluorotropacocaine	NPS	€10,000/kg
Flurazepam	Benzodiazepine	N/A
GBL	Solvent	€200/L
GHB	Solvent	€200/L
JWH-018	Synthetic cannabinoid	€5,000/kg
JWH-073	Synthetic cannabinoid	€5,000/kg
JWH-250	Synthetic cannabinoid	€5,000/kg
Ketamine	Hallucinogen	€10,000/kg
Khat	Hallucinogen	€100/kg
Lorazepam	Benzodiazepine	N/A
Lormetazepam	Benzodiazepine	N/A

Drug	Category	Price per kilogram/per litre
LSD	Hallucinogen	N/A
Lysergamide	Hallucinogen	NE
MAM-2201	Synthetic cannabinoid	NE
MBZP	Piperazine	€10,000/kg
mCPP	Piperazine	€10,000/kg
MDA	Phenethylamine	€10,000/kg

Psilocin	Hallucinogen	€10,000
Psilocybin	Hallucinogen	€10,000
PVP	Cathinone	€10,000/kg
RCS-4	Synthetic cannabinoid	NE
Salvinorin A	Hallucinogen	NE
STS-135	Synthetic cannabinoid	NE
Temazepam	Benzodiazepine	N/A
Triazolam	Benzodiazepine	N/A
UR-144	Synthetic cannabinoid	NE
Zolpidem	Sleeping agent	N/A
Zopiclone (not controlled)	Sleeping agent	N/A

Note: NE = no evidence; N/A = not applicable.

Source: (personal communication, GNDOCB, 2021)

* Cannabis plants are valued based on the potential yield of the plant. An actual market value can only be applied when plants are fully mature and ready for sale. Charges contrary to Section 15A of the Misuse of Drugs Act (as amended) are not applied in relation to nursery plants or plants that are not fully mature.

Adulterants

The FSI laboratory analyses drugs seized by gardaí and other law enforcement agencies. Adulterant data are classified as 'street level' where submitted samples are defined as seizures less than 30 g (25–30 g), and as 'importation level' where submitted samples are defined as seizures over 500 g (personal communication, FSI, 2020). Data are available for diamorphine (2019 and 2020), and amphetamines (2020), and each is presented separately. No data is available for cocaine in 2020.

Diamorphine

Heroin consists of several naturally occurring substances that are extracted from the opium poppy. One substance that is found in heroin is diamorphine (personal communication, FSI, 2020). Adulterants are defined as substances which are typically added after the extraction of diamorphine, not naturally occurring compounds. Some naturally occurring compounds typically found in heroin samples include noscapine, papaverine, and acetylcodeine.

2019 adulterant analysis

Overall, in 2019, 21 diamorphine seizures were submitted to FSI for quantification analysis, of which 6 seizures were classified as street-level substances and 15 seizures were classified as importation-level substances. Seizures at importation level resulted in the analysis of 17 samples. Dates of seizures ranged from (street level) and from 18 January 2019 to 5 November 2019 (importation level).

Table T1.1.4.2 shows a breakdown of the number of adulterants detected by year. On average, in street and importation levels, at least one adulterant was found in analysed samples in 2019: 83.3% and 64.7% respectively. The most prevalent adulterant detected was caffeine, followed by paracetamol. While either caffeine or paracetamol was detected in all samples analysed, both adulterants were detected in 2019 (56.5%) and 2020 (69.3%) of analysed samples. Further examination of street and importation levels indicated that the prevalence of caffeine and paracetamol at street level was similar in 2019 (approximately 83.3%). However, at the importation level, the prevalence of caffeine (64.7%) was higher than that of paracetamol (47.0%) in 2019 (personal communication, FSI, 2021).

2020 adulterant analysis

Overall, in 2020, 26 diamorphine seizures were submitted to FSI for quantification analysis, of which 16 seizures were classified as street-level substances and 10 seizures were classified as importation-level substances. Seizures at importation level resulted in the analysis of 12 samples. Dates of seizures ranged from 13 January 2020 to 16 November 2020 (street level) and from 3 January 2020 to 5 August 2020 (importation level). In 2020, a “street deal” survey was also carried out. The FSI define street deal samples as samples taken from typical street deal size packs

Table T1.1.4.2 shows a breakdown of the number of adulterants detected by year. On average, in street and importation levels, at least one adulterant was found in analysed samples in 2020: 87.5% and 58.3% respectively. The most prevalent adulterant detected was caffeine, followed by paracetamol. While either caffeine or paracetamol was detected in all samples analysed in 2020, both adulterants were detected in 69.3% of analysed samples. This figure also included samples from the street level deals survey. Further examination of street and importation levels in 2020 indicated that the prevalence of caffeine and paracetamol at street level (87.5% and 75% respectively), and at importation level (58.3% and 50% respectively) (personal communication, FSI, 2021).

Table T1.1.4.2 Number of adulterants detected in diamorphine samples, by year

	2016	2017	2018	2019	2020
Number of adulterants	% of samples	% of samples	% of samples	% of samples	% of samples
0	52.9	24.0	51.4	30.4	25.0
1	8.8	4.0	5.4	13.0	
2	41.2	68.0	43.2	52.1	
3	–	4.0	–	4.3	

Note. “–” = not detected

Source: (personal communication, FSI, 2020, 2021)

Amphetamines

Between 03 January 2020 and 12 December 2020, 32 amphetamine seizures were submitted for analysis, from which 33 samples were taken. 93.9 per cent of samples submitted contained at least one adulterant. Table T1.1.4.5 shows an overall breakdown of adulterants between 2016 and 2020. Caffeine was detected in all adulterated samples (personal communication, FSI, 2020, 2021).

Table T1.1.4.3 Percentage of adulterants detected in amphetamine samples, by year

	2016	2017	2018	2019	2020
	% of samples	% of samples	% of samples	% of samples	% of samples
No adulterants	25.0	6.3	7.5	10.5	6.1
Caffeine	75.0	93.7	92.5	89.5	93.9
Methamphetamine	12.5	–	–	–	–
Fluoroamphetamine	6.2	–	–	–	–
Lignocaine	–	–	3.7	–	–

Note. “–” = not detected

Nature and organisation of buyers, sellers, and intermediaries

The main organisations running drug markets on the island of Ireland are OCGs. As stated in the previous Drugs market and crime workbooks, the most recent data from cross-border reports highlighted that drugs and drug-related criminality have remained a concern throughout the island (Police Service of Northern Ireland and An Garda Síochána 2018). Although ‘traditional’ drug importation routes are unchanged, the emergence of the Dark Web and NPS, as well as the misuse of prescription medications, have resulted in changes in drug abuse and OCG criminality.

‘Traditional’ drugs remain prominent. For example:

- Cannabis continues to be the most prevalent drug used/abused on the island of Ireland. At €29/£20 per gram, it is viewed as profitable by OCGs involved in wholesale importation and supply. Cannabis herb blocks or cultivated cannabis plants are mainly seized in the Republic of Ireland (ROI). However, other products – for example, cannabis resin and cannabis oil – have also been seized. Irish national OCGs are deeply implicated in this area, controlling both supply routes and grow houses.
- Improved economic conditions have resulted in the recently increased demand for cocaine and MDMA. Although it is possible to sell these drugs on the Dark Web, they do form a small part of OCG importations. OCGs that participate in ‘polydrug dealing’ are typically smaller than traditional wholesale importers. As a result, they can present issues for law enforcement trying to target the problem (Police Service of Northern Ireland and An Garda Síochána 2018).
- Heroin continues to be a problem across Ireland. While the most problematic area is Greater Dublin, in recent years similar problems have arisen in small urban centres and in rural towns and villages. Most opioid users reside in Dublin (71%) and are over 35 years of age (>50%). Heroin issues in the

ROI are viewed as “stable and entrenched” (Police Service of Northern Ireland and An Garda Siochana 2018) (p. 7). By contrast, in Northern Ireland (NI), the most problematic area is Belfast city centre, where drug use can be observed every day on the streets.

- In contrast to previous assessments, crack cocaine has recently emerged as an issue for law enforcement agencies and communities. For now, it is not viewed as a nationwide issue, but it is believed that it will need to be targeted in the future.
- Synthetic opioids have been a characteristic of Irish OCG activity since 2016. Although reported seizures of these products are low, only 0.02 mg of the synthetic opioid carfentanil is needed in order to produce a fatal overdose. While this is not currently a crisis in the ROI and NI, there is evidence to suggest that OCGs are selling products on the premise that they are heroin, but in fact are heroin mixed with synthetic opioids and/or bulking agents.
- Another problem is that some OCGs are introducing synthetic opioids into the drug supply chain, and this is placing drug users at considerable risk. This problem has been identified as an area that requires ongoing attention and monitoring.
- Prescription medication is an issue across the ROI and NI and involves the importation, manufacture, and sale of pharmaceutical products. Benzodiazepines are popular with individuals who are using heroin, managing pain, or trying to improve cognitive and/or physical function.
- Another emerging trend is the use of amphetamines by individuals attending third-level education. Targeting the illegal sale of these products is becoming more and more challenging. However, as prescription drug abuse increases, so too will the issues around it.

Primarily, the cross-border elements of drug crime across Ireland centre on relationships between OCGs in the ROI and NI in the areas of control and supply. Although the links between ROI and NI OCGs are extensive, collaborations between Irish OCGs and foreign national OCGs are stronger, as foreign national OCGs see Ireland as one market. The most important supply route on the island is between Dublin and Belfast. This is due to excellent infrastructure linking both areas via motorways and transport systems. Irish OCGs make it possible for NI OCGs to access European drug markets, such as Spain, the Netherlands, and the UK. Consequently, joint collaborations between the PSNI and AGS often involve collaborating with international agencies with the aim of stopping drug supply routes north and south of the border (Police Service of Northern Ireland and An Garda Siochana 2018).

T1.1.5 Retail drug market

Range and relative importance of different products

Seizure records for illegal drugs in Ireland provide the best source of data regarding the range and relative importance of different drugs on the Irish retail market. Based on FSI records, Table T1.1.5.1 lists the top 20 illegal drugs that are most prominent in Ireland in descending order by quantity seized. Trends relating to these substances and others can be found in Section T2.1 of this workbook.

Table T1.1.5.1 Prominent illegal drugs in Ireland based on FSI records for 2020

	Drug type	Quantity seized
1	Cannabis	3166
2	Cocaine	1994

	Drug type	Quantity seized
3	Diamorphine	1017
4	Alprazolam	744
5	MDMA	632
6	Zopiclone	301
7	Cannabis Plant	277
8	Cannabis resin	263
9	Benzocaine	225
10	Amphetamine	185
11	Ketamine	169
12	Diazepam	163
13	Etizolam	146
14	Creatine/Creatinine	92
15	THC	69
16	Delorazepam	62
17	Adinazolam	43
18	Methadone	41
19	Flualprazolam	40
20	Paracetamol	35

Source: (personal communication, FSI, 2021)

Drug prices

Table T1.1.5.2 shows drug prices based on the current retail market value of controlled drugs on the retail drug market in October 2020. The prices indicated represent what that substance will sell for on average around the ROI in its lowest denominational street deal. No price change occurred between 2017 and 2020. As stated in previous workbooks, the most credible approach used to set prices on the retail market is via test purchase operations, where gardaí buy drugs in undercover work. The second approach is via intelligence, which is drawn from covert intelligence sources. The third is to evaluate and compare the experiences of drug units nationwide using self-report surveys. Based on all three sources, plus the experience of officers in drug policing, prices are calculated systematically (personal communication, GNDOCB, 2017). This method has illustrated that prices vary at different times; for example, the price of a gram of cannabis in Ennis, Co Clare would be different from the price of a gram purchased in Ballyfermot, Dublin.

Table T1.1.5.2 Drug prices based on current retail market value of controlled drugs, October 2019

Drug	Category	Price per gram/tablet/millilitre
Alprazolam	Benzodiazepine	€2 per tablet
Amphetamine	Phenethylamine	€15 per gram
AM-2201	Synthetic cannabinoid	€20 per gram
AMT	Tryptamine	€200 per gram
Benzylpiperazine	Piperazine	€5 per tablet/€50 per gram
Butylone	Cathinone	€50 per gram
BKMBDB	Cathinone	€50 per gram
Bromazepam	Benzodiazepine	€1 per tablet
Cannabis resin	Cannabis	€6 per gram
Cannabis herb	Cannabis	€20 per gram
Cannabis plants*	Cannabis	€800
Cocaine	Cocaine	€70 per gram
Chlordiazepoxide	Benzodiazepine	€1 per tablet

Drug	Category	Price per gram/tablet/millilitre
Clobazam	Benzodiazepine	€1 per tablet
Clonazepam	Benzodiazepine	€1 per tablet
CPP	Piperazine	€5 per tablet/€50 per gram
Diamorphine (heroin)	Opioid	€140 per gram
Dimethylone	Cathinone	€50 per gram
Diazepam	Benzodiazepine	€1 per tablet
DMT	Tryptamine	€200 per gram
DMAA	Phenethylamine	€60 per gram
Ethcathinone	Cathinone	€50 per gram
Ethylone	Cathinone	€50 per gram
Flephedrone	Cathinone	€50 per gram
Fluorotropacocaine	NPS	€50 per gram
Fluoroamphetamine	Phenethylamine	€15 per gram
Flunitrazepam	Benzodiazepine	€1 per tablet
Flurazepam	Benzodiazepine	€1 per tablet
GHB	Solvent	€1 per millilitre
GBL	Solvent	€1 per millilitre
JWH-018	Synthetic cannabinoid	€20 per gram
JWH-073	Synthetic cannabinoid	€20 per gram
JWH-250	Synthetic cannabinoid	€20 per gram
Ketamine	Hallucinogen	€60 per gram
Khat	Hallucinogen	€0.50 per gram
LSD	Hallucinogen	€10 per tablet
Lysergamide	Hallucinogen	€20 per gram
Lorazepam	Benzodiazepine	€1 per tablet
Lormetazepam	Benzodiazepine	€1 per tablet
MAM-2201	Synthetic cannabinoid	€20 per gram
MBZP	Piperazine	€5 per tablet/€50 per gram
mCPP	Piperazine	€5 per tablet/€50 per gram
MDMA	Phenethylamine	€10 per tablet/€60 per gram
MDEA	Phenethylamine	€10 per tablet/€60 per gram
MDA	Phenethylamine	€10 per tablet/€60 per gram
MDPBP	Cathinone	€50 per gram
MDPV	Cathinone	€50 per gram
MEC	Cathinone	€50 per gram
Methadone	Opiate	€20 per 100 millilitres
Mephedrone	Cathinone	€50 per gram
Methylone	Cathinone	€50 per gram
Methedrone	Cathinone	€50 per gram
Methylamphetamine	Phenethylamine	€60 per gram
Methoxyamphetamine	Phenethylamine	€60 per gram
Methoxetamine	Hallucinogen	€60 per gram
Methylphenidate	Phenethylamine	€60 per gram
Mirtazapine	Benzodiazepine	€1 per tablet
MMC	Cathinone	€50 per gram
Naphyrone	Cathinone	€50 per gram
Nitrazepam	Benzodiazepine	€1 per tablet
Pentedrone	Cathinone	€50 per gram
Phentermine	Phenethylamine	€10 per tablet/€60 per gram
Phenazepam (not controlled)	Benzodiazepine	€1 per tablet
PMA	Phenethylamine	€10 per tablet/€60 per gram
PMMA	Phenethylamine	€10 per tablet/€60 per gram
Prazepam	Benzodiazepine	€1 per tablet
Psilocin	Hallucinogen	€10 per gram
Psilocybin	Hallucinogen	€10 per gram
PVP	Cathinone	€50 per gram

Drug	Category	Price per gram/tablet/millilitre
RCS-4	Synthetic cannabinoid	€20 per gram
Salvinorin A	Hallucinogen	€20 per gram
STS-135	Synthetic cannabinoid	€20 per gram
Temazepam	Benzodiazepine	€1 per tablet
Triazolam	Benzodiazepine	€1 per tablet
UR-144	Synthetic cannabinoid	€20 per gram
Zolpidem	Sleeping agent	€2 per tablet
Zopiclone (not controlled)	Sleeping agent	€2 per tablet
2C-B	Phenethylamine	€10 per tablet/€60 per gram
2C-E	Phenethylamine	€10 per tablet/€60 per gram
2C-I	Phenethylamine	€10 per tablet/€60 per gram
25I-NBOMe	Hallucinogen	€10 per tablet
5AKB48 (not controlled)	Synthetic cannabinoid	€20 per gram

Source: (personal communication, GNDOCB, 2021)

* Cannabis plants are valued based on the potential yield of the plant. An actual market value can only be applied when plants are fully mature and ready for sale. Charges contrary to Section 15A of the Misuse of Drugs Act (as amended) are not applied in relation to nursery plants or plants that are not fully mature.

Purity of drugs seized and pack sizes

Data for pack sizes and purity of drugs seized are obtained from FSI (personal communication, FSI, 2021). The most recent available data are for diamorphine (2019 and 2020), and amphetamines (2020). A further breakdown is available for street-level and importation-level diamorphine. The FSI has operationally defined Street-level samples as samples submitted from seizures of less than 30 grams (primarily between 25 and 30 grams), and Importation-level samples as samples submitted from seizures of more than 500 grams. Additionally, in 2020, a diamorphine street deals survey was carried out. The FSI define street deal samples as samples taken from typical street deal size packs. The results of the analysis of each substance will be presented separately.

Diamorphine

Table T1.1.5.3 shows a summary of purity analyses for diamorphine seizures between 2016 and 2020. Data are provided for street- and importation-level seizures. Between 2016 and 2018, the overall average purity ranged from 35.1% to 42.7%. The overall average purity of street and importation level diamorphine decreased in 2019 (36.6%) and again in 2020 (35.4%). While a further examination by classification level indicated that the average purity for importation-level diamorphine was slightly higher than the average purity of street-level diamorphine between 2016 and 2019. In 2020, the difference between average purity in street-level diamorphine and importation-level diamorphine is more notable, 29.6% and 43.1% respectively.

Table T1.1.5.3 Summary of purity and pack sizes for diamorphine seizures between 2016 and 2020

Year	Level	Number of seizures	Seizure size range	Number of samples	Pack size range	Purity	Average purity	Overall average purity (Street and Importation)
2016	Street	6	25.7 g to 29.6 g	6	25.7 g to 1.8 kg	22.9–53.9%	40.6%	42.7%

Year	Level	Number of seizures	Seizure size range	Number of samples	Pack size range	Purity	Average purity	Overall average purity (Street and Importation)
2017	Importation	21	447.0 g to 2.6 kg	28	25.7 g to 1.8 kg	13.6–54.5%	43.1%	35.1%
	Street	11	3.3 g to 29.4 g	11	1.8 g to 1.2 kg	15.2–59.6%	30.4%	
2018	Importation	12	461.8 g to 11.6 kg	14	1.8 g to 1.2 kg	10.1–61.0%	38.9%	42.0%
	Street	16	0.77 g to 35.9 g	16	0.2 g to 7.1 kg	12.0–90.0%	38.4%	
2019	Importation	17	459.7 g to 14.0 kg	21	0.2 g to 7.1 kg	9.5–78.2%	44.8%	36.6%
	Street	6	1.5 grams to 36.2 g	6	–	16.3–58.7%	32.3%	
2020	Importation	15	437.4 g to 8.9 kg	17	25.715 g to 1.7 kg	1.0–62.8%	38.1%	35.4%
	Street	16	0.3 g to 36.0 g	16	0.152 g to 36.0 g	8.3–61.9%	29.6%	
	Importation	10	498.0 g to 18.7 kg	12	123.7 g to 1.0 kg	5.5–65.7%	43.1%

Street Deals

In addition to the analysis of street and importation level samples in 2020, a survey of street deals was carried out. The FSI define street deal samples as samples taken from typical street deal size packs. The aim was to give a snapshot for the diamorphine content a typical pack contains. Samples were collected from various locations in Ireland over a 12-month period. Overall, 21 samples were analysed in this survey. Figure T1.1.5.1 shows the average diamorphine content of the street deal survey samples in 2020. Purity content ranged from 30.3% to 37.7% and the overall average content was 33.4%.

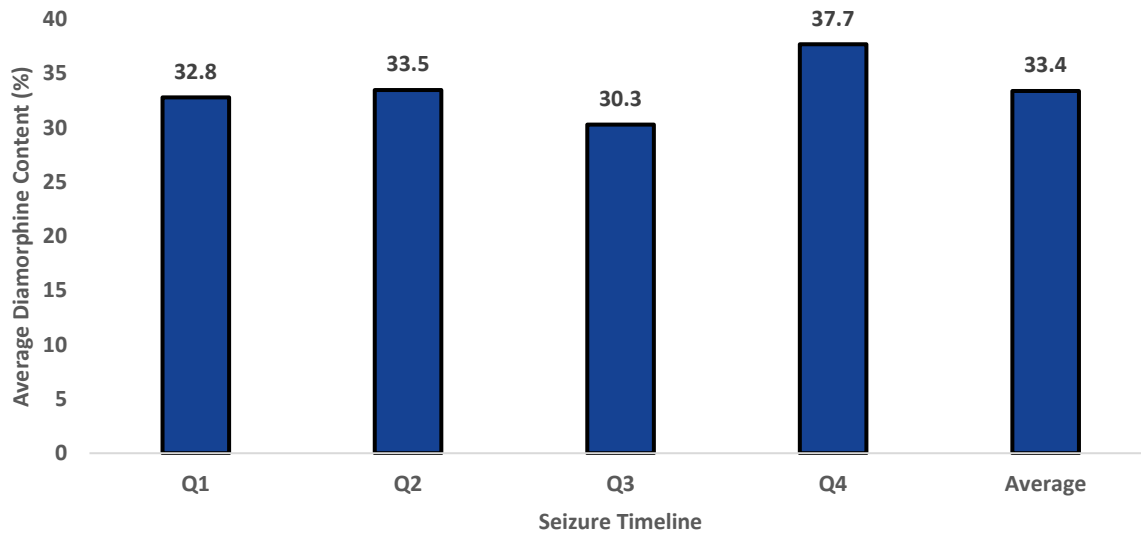

Figure T1.1.5.1 Average diamorphine content of the “street deal” survey samples in 2020

Source: (personal communication, FSI, 2020, 2021)

Amphetamines

Table T1.1.5.4 shows a summary of purity analyses for amphetamine seizures between 2016 and 2020. The overall average purity ranged from 6.7% to 9.4%. Purity levels decreased between 2017 and 2019, however a slight increase was evident in 2020.

Table T1.1.5.4 Summary of purity and pack sizes for Amphetamine seizures between 2016 and 2020

Year	Number of seizures	Seizure size range	Number of samples	Pack size range	Purity	Overall average purity
2016	16	13.3 g to 1.2 kg	15	1.8 g to 793.7 g	0.5–40.0%	7.1%
2017	16	30.6 g to 386.8 g	15	17.1 g to 235.4 g	0.7–16.6%	9.4%
2018	26	27.6 g to 3.7 kg	27	2.1 g to 1.1 kg	0.7–15.4%	7.4%
2019	19	27.0 g to 16.4 kg	19	25.3 g to 2.0 kg	0.6–13.3%	6.7%
2020	32	25.8 g to 995.5 g	33	4.4 g to 995.5 g	0.1–15.6%	7.6%

T1.2 Drug related crime

T1.2.1 Drug law offences

Data regarding drug law offences are provided by the Courts Service and the Irish Prison Service (IPS) via their annual reports.

Court outcomes for drug offences

The *Courts Service Annual Report 2020* presented statistics on prosecutions for drug offences between January and December 2020 (Courts Service 2021). Notably, data provided are for overall drug law offences. The Courts Service does not distinguish between the different supply offences and possession/use offences (personal communication, Courts Service, 2017).

District Court

In most cases, prosecutions for drug offences are carried out in the District Court, which is the lowest court in the Irish legal system. The District Court, exercising its criminal jurisdiction, deals with four types of offences: summary offences, indictable offences tried summarily, some indictable offences, and indictable offences not tried summarily. When the District Court hears a criminal case, the judge sits without a jury. The District Judge decides the issues of fact and whether to convict. He or she also determines the sentence. In the case of most indictable offences which must be tried by a judge sitting with a jury, the District Court may impose a sentence where the accused pleads guilty, provided that the Director of Public Prosecutions consents, and the judge accepts the guilty plea. Otherwise, the accused is sent forward to the Circuit Court on their signed guilty plea for sentencing. The District Court has a limit on the sentence it may impose in respect of a single criminal charge, which is 12 months' imprisonment (Courts Service 2013). Overall, 16,456 orders were made in relation to drug offences in 2020 – involving 22,750 defendants – which represents a 14% increase since 2019 (N=19,153) (Courts Service 2021) (see Table T1.2.1.1 and Table T1.2.1.2).

Table T1.2.1.1 Sentences for drug offences in the District Court, 2019

Incoming		Resolved: offences		
Offences	Defendants*	Summary	Indictable dealt with summarily	Sent forward for trial
38 635	22 750	1 313	15 143	2 780

Source: (Courts Service 2021)

* There may be more than one offence brought against a defendant.

Table T1.2.1.2 Summary and indictable offences: outcomes in District Court, 2020

	Dis	S/O	TIC	Fine	Bond	Disq	C/S	Prob	Imp/det	Susp	Other	Fixed	Total
Summary offences: outcomes	46	204	107	357	3	330	5	48	38	29	136	–	1313
Indictable offences dealt with summarily: outcomes	270	3412	1669	2458	64	4	139	1915	403	504	4305	–	15143

Note: Dis = Dismiss; S/O = strike out; TIC = taken into consideration; Disq = disqualified; C/S = community service; Prob = probation; Imp/det = imprisonment or detention; Susp = suspended sentence.

Source: (Courts Service 2021)

Juvenile crime

The age of criminal responsibility in Ireland is 12 years (Section 52 of the Children Act, 2001, as amended by Section 129 of the Criminal Justice Act 2006). Generally, children who come before the courts are aged between 15 and 17 years. The total number of orders that were made in respect of drug offences in the Children Court in 2020 was 224 (see Table T1.2.1.3) (Courts Service 2021) which represented approximately 53% decrease since 2019 (N = 478). In 2020, two young offenders were imprisoned or detained and

approximately 17% of young offenders were sentenced to community service (n=1) or probation (n=38). The number of young people placed on probation in 2020 (n=38) was nearly one-third less than 2019 figure (n=120).

Table T1.2.1.3 Juvenile crime outcomes in 2020

Dis	S/O	TIC	Fine	Bond	Disq	C/S	Prob	Imp/det	Susp	Other	Total
13	46	87	11	2	3	1	38	2	4	17	224

Note: Dis = Dismiss; S/O = strike out; TIC = taken into consideration; Disq = disqualified; C/S = community service; Prob = probation; Imp/det = imprisonment or detention; Susp = suspended sentence.

Source: (Courts Service 2021)

Circuit Court

The Circuit Court heard cases for 673 defendants that involved 3,261 drug offences in 2020. There were 1,758 guilty pleas, which represented near 4% decrease from 2019 (N=1,831); of the cases that went to trial, 15 resulted in convictions and 9 resulted in acquittals (see Table T1.2.1.4). Trials resulted in 257 imprisonments/detentions and 331 suspended sentences (see Table T1.2.1.5) (Courts Service 2021)

Table T1.2.1.4 Sentences for drug offences in the Circuit Court in 2020

Incoming		Resolved: offences							
Offences	Defendants*	Guilty	Trials	Convicted	Acquitted	NP	TIC	Quash	Dec
3261	673	1758	15	9	713	277	0	2	

Note: Guilty = guilty pleas; NP = *nolle prosequi*; TIC = taken into consideration; Quash = quash return for trial; Dec = accused deceased.

* There may be more than one offence brought against a defendant.

Source: (Courts Service 2021)

Table T1.2.1.5 Offence outcomes following conviction in the Circuit Court in 2020

	TIC	Fine	Bond	Disq	C/S	Prob	Imp/det	Susp	Other	Total
Offence outcomes following conviction	146	5	431	3	19	61	257	331	526	1779

Note: TIC = taken into consideration; Disq = disqualified; C/S = community service; Prob = probation; Imp/det = imprisonment or detention; Susp = suspended sentence.

Source: (Courts Service 2021)

Appeals (from District Court)

In 2020, 387 appeals from the District Court, representing 764 offences, were dealt with in the Circuit Court (Courts Service 2021). Appeals and Offences were, 6.6% and 14% higher than 2019 (appeals=363; offences=669). Table T1.2.1.6 shows a breakdown of resolved offences.

Table T1.2.1.6 Appeals from District Court, 2020

Incoming		Resolved: offences					
Off	Def	Aff	Varied	Rev	S/O	S/O N/A	
764	387	86	295	96	114	65	

Note: Off = offences; Def = defendants; Aff = affirmed; Rev = reversed; S/O = struck out; S/O N/A = struck out no appearance.

Source: (Courts Service 2021)

Court of Appeal

Overall, the number of appeals that were lodged from the Circuit Criminal Court for drug/misuse of drugs offences increased by nearly 14% from 2019 (N=59) to 2020 (N=67). Overall, 66 appeals which originated in the Circuit Criminal Court were resolved in 2020 and 1 appeal originating in the Special Criminal Court. This was similar to the number resolved in 2019 (N=65) (Courts Service 2021). Table T1.2.1.7 indicates that most appeals resolved were for sentence severity (n=50), followed by conviction and sentence (n=6) and sentence leniency (n=6).

Table T1.2.1.7 Summary of resolved appeals in 2020

Appeal	Conviction	Sentence (severity)	Conviction and sentence	Sentence (leniency)	Director of Public Prosecutions (dismissal)	Miscarriage of Justice	Other	Total
Resolved	3	50	6	6	0	0	2	67

Prison committals for drug offences

The IPS Annual Report 2020 provided statistics on the number of persons in custody under sentence (i.e., not on remand) on a given day in that year (30 November) and on the number of committals under sentence, by sentence length (Irish Prison Service 2003). On 30 November 2020, the number of persons in custody for controlled drug offences comprised 10.5% (322 out of 3059) of the total prison population. The difference between the share of the total prison population in 2019 (11.2% – 358 out of 3208) and 2020 is a 0.7 percentage point decrease, while the decrease in the actual number of persons in custody from 2019 (358) to 2020 (322) is 10%. Of those in custody for drug offences, 205 were under a sentence of 5 years or longer; of these, 28 were under a sentence of 10 years or longer. Twenty-eight prisoners were under a sentence of 12 months or less (Irish Prison Service 2021).

Between 2019 and 2020, the number of committals for drug offences decreased by nearly 33% (n=160), which was significantly greater than the increase evident between 2018 and 2019 (23%, n=91). Of the 325 committals to prison during 2020, 18 (5.5%) were for sentences of 3 months or less (Irish Prison Service 2021). The reduced number of committals in 2020 can be explained by the Covid-19 pandemic. The increasing trend evident in 2019 continued until March 2020, once restrictions were implemented the increasing trend reversed (Irish Prison Service 2021). Further information on prisons can be found in Section T1.2.1. of the *Prison workbook*.

T1.2.2 Drug related crime outside drug law offences (optional)

T1.3 Drug supply reduction activities

T1.3.1 Drug supply reduction

a) Key priorities of supply reduction

Four documents illustrate the importance of the law enforcement response to drug trafficking in Ireland: *An Garda Síochána Strategy Statement 2019-2021* (An Garda Síochána Strategic Planning Unit 2020); *An Garda Síochána Annual Policing Plan 2020* (An Garda Síochána n.d.). *An Garda Síochána Crime Prevention & Reduction Strategy: Putting Prevention First* (An Garda Síochána 2017); and the national drugs strategy, *Reducing Harm, Supporting Recovery: A health-led response to drug and alcohol use in Ireland 2017–2025*, which commenced in 2017 (Department of Health 2017).

An Garda Síochána Strategy Statement 2019-2021

An Garda Síochána Mission and Strategy 2019-2021 was published on July 17, 2019 (An Garda Síochána Strategic Planning Unit 2020). The An Garda Síochána (AGS) mission for the duration of the strategy is simply “Keeping People Safe” (p. 3). Progress through this strategy will be achieved incrementally by implementing various initiatives through the annual Policing Plans. The areas that the strategy focuses on are:

- community policing
- protecting people
- a secure Ireland
- a human rights foundation
- our people – our greatest resource
- transforming our services.

Initiatives related to these areas will be highlighted in the next section.

An Garda Síochána Annual Report Policing Plan 2019

An Garda Síochána Annual Report Policing Plan 2020 represented the second stage in the implementation of *An Garda Síochána Strategy Statement 2019-2021*. The plan was prepared against the backdrop of the global pandemic where the impacts to society and AGS were uncertain (An Garda Síochána n.d.). This is the Second of three plans proposed by Garda Commissioner, Drew Harris, that will implement the new strategy through numerous initiatives which will gradually assist AGS to reach its strategic outcomes (An Garda Síochána Strategic Planning Unit 2020). Six areas have been highlighted by AGS in 2020:

Community policing – In 2020, AGS started implementing its new community policing framework in which will continue into 2021. The support required by AGS to support the Government response to the impact of Covid-19 is aligned with AGS’s strategic objectives for community policing where AGS interacts and collaborates with communities and stakeholders to determine what their policing needs are and how to achieve them.

Protecting people – In 2020 AGS will progress initiatives which will enhance capacity to respond to crime. The impact of COVID-19 will change depending on crime type. This involves reducing crime and the fear of crime via multi-agency diversion activities, providing crime prevention advice, and responding to evolving threats. The aim is to respond proactively to emerging crime trends by concentrating on protecting those that are vulnerable.

Secure Ireland – AGS will continue improve security capabilities by implementing recommendations put forward in *A Policing Service for the Future: Implementing the Report of the Commission on the Future of Policing in Ireland* (Government of Ireland 2019). For example, AGS intends to carry out intelligence-led

operations nationally and internationally to address terrorism. Gardaí will receive specialised training in accordance with international best practice to help them locate and seize finances used for this purpose.

A human rights foundation – In 2020, AGS will continue to build a policing infrastructure that is centred on human rights. AGS aims to embed human rights and ethical behaviour into how gardaí police, and specifically how they deal with criminal service users who are vulnerable.

Our people – our greatest resource – AGS aims to increase engagement and support, and to provide opportunities for continuous development. The new *People Strategy 2019–2021* (An Garda Síochána 2019a) will be implemented and will help determine whether gardaí are in the role most suited to them, in the right place and time. In addition, it is intended to establish a learning culture and to increase leadership capacity via leadership training. Excellent performance will be encouraged and acknowledged. Underperformance and unethical behaviour will be targeted. In order to support health and wellness, AGS will invest in employees' well-being.

Transforming our services – AGS aim to continue to implement new operational model. Regardless of Covid-19, they are committed to provide a more effective service, build public confidence via greater accountability and transparency, and improve communication both internally and externally.

Although drugs are not mentioned specifically, it is implied throughout the document that drugs will be targeted (An Garda Síochána n.d.). Responsibility for actioning and reporting on the progress of each initiative in the plan has been assigned to an assistant commissioner or executive director, who will then report to the Commissioner and the Policing Authority once a month. Moreover, key performance indicators will be used to statistically determine that improvement has occurred in several areas, such as public perception, public safety and demand, offender accountability, roads policing, victim engagement, and data quality-related activity (An Garda Síochána n.d.).

The Commissioner acknowledged that Covid-19 has caused significant disruption, however, AGS has taken significant steps to ensure that the Government response is supported. While it is believed that this will be short-term, it will impact on their capacity to progress other important tasks.

In addition, Commissioner Harris is committed to “holding the organisation to account for performance against this plan, which will move us closer to addressing the challenges identified in the culture audit, improving on organisational performance and ultimately achieve our mission of Keeping People Safe.” (p. 4) (An Garda Síochána n.d.).

An Garda Síochána Crime Prevention & Reduction Strategy: Putting Prevention First

As stated in previous Drug markets and crime workbooks, the 2017 *An Garda Síochána Crime Prevention & Reduction Strategy: Putting Prevention First* (An Garda Síochána 2017) draws on United Nations guidelines (United Nations Economic and Social Council 2002) and complements the policing and security sections of the *Modernisation and Renewal Programme 2016–2021* (An Garda Síochána 2015). The strategy is underpinned by a problem-solving approach that is based on a strong evidence base. The National Crime Prevention Unit and Divisional Crime Prevention Officers are critical to its successful implementation in Ireland. The strategy is centred on four pillars:

- building strategic crime prevention capacity
- operating a professional crime prevention service via partnership and collaboration with communities
- implementing customised crime prevention approaches with communities

- communicating crime prevention messages to the public.

Reducing Harm, Supporting Recovery: A health-led response to drug and alcohol use in Ireland 2017–2025

Reducing Harm, Supporting Recovery: A health-led response to drug and alcohol use in Ireland 2017–2025, the national drugs strategy in Ireland, was launched in 2017. It is aimed at providing an integrated public health approach to drug and alcohol use by focusing on the promotion of healthier lifestyles within society. It consists of five goals and aims to target a 50-point action plan from 2017 to 2025. Goal 3 sets out key actions for reducing the supply of drugs:

- provide a comprehensive and responsive misuse of drugs control framework which ensures the proper control, management, and regulation of the supply of drugs
- implement effective law enforcement and supply reduction strategies and actions to prevent, disrupt, or otherwise reduce the availability of illegal drugs
- develop effective monitoring of, and responses to, evolving trends, public health threats, and the emergence of new drug markets.

Further information on this strategy can be found in Section T1.1 of the *Drug policy workbook* and in Section T4.2 of *Focal Point Ireland: national report for 2017 – Drug markets and crime* (Irish National Focal Point to the European Monitoring Centre for Drugs and Drug Addiction 2018a). Results of an evaluation of this strategy can be found in Section T1.2.2 of the *Drug policy workbook*.

b) Areas of activity of supply reduction

As stated in previous workbooks, the following account describes the range of operations in the areas of drug interdiction, organised crime, policing communities, and reducing reoffending. The account is drawn from information published in the reporting period (August 2014 to September 2021) on the websites and in the annual reports of the key agencies involved in supply reduction activities, and in responses to Parliamentary Questions.

Drug interdiction

The Revenue Commissioners’ Operational Intelligence Unit gathers data with a view to identifying possible drug smuggling routes into Ireland via passenger and cargo traffic; analysing the movement of persons and goods on those routes; and profiling, targeting, and conducting routine surveillance of suspect persons or consignments (Revenue Commissioners 2019a). Many drug seizures result from profiling techniques based on risk analysis. The Operational Intelligence Unit transmits intelligence and details of suspect traffic to the local operational units, whose functions include the examination of suspect passengers’ baggage and freight consignments; the search of suspect persons, vehicles, vessels, pleasure craft, aircraft, etc.; and the transmission of information to the Operational Intelligence Unit for further action.

The Revenue Commissioners’ Maritime Unit, based in Cork, is equipped with rigid inflatable boats and two Revenue Commissioners Customs cutters tasked with the prevention, detection, interception, and seizure of controlled drugs, fiscal goods, arms/ammunition/explosives, and prohibited and restricted goods smuggled or illegally imported into, or intended to be exported out of, Ireland or the European Union (EU). When not engaged in operational duties, Maritime Unit personnel are involved in coastal intelligence work.

Drug detector dog units form an important component of policing in Ireland. Detector dogs are trained to locate cocaine, cannabis, ecstasy, heroin, tobacco products, and cash. Units are based at strategic locations, including ports and airports around Ireland, by the Revenue Commissioners Customs Service. For operational

and security reasons, performance statistics are not provided out of respect for individual detector dogs. These units are on call 24/7 all year round. When required, they provide backup to other enforcement agencies.

Similarly, Garda Dog Units have been providing an operational support service for approximately 58 years. One unit is mainly based at Kilmainham Garda Station in Dublin, while another is in the Southern Region. The most recent data available indicate that the Garda Dog Unit was involved in approximately 435 searches in 2019 (An Garda Síochána 2020). These included searches for missing persons, drugs, firearms and explosive substances, and stolen goods (An Garda Síochána 2020).

The Customs Drugs Watch Programme, launched by the Revenue Commissioners in 1994, encourages those living in coastal communities, maritime personnel, and people living near airfields to report unusual occurrences to the Customs Service via a confidential 24/7 drugs watch freephone facility.

The Revenue Commissioners also uses mobile X-ray scanners in the fight against smuggling. A state-of-the-art X-ray scanner was launched in June 2017; this was partially funded by a grant from OLAF, the European Anti-Fraud Office, under its Hercule III Programme. It was viewed as the most advanced on the market and avails of imaging technology to analyse vehicles as well as shipping containers. It was deployed in Dublin Port (Revenue Commissioners 2018). In 2019, a new mobile X-ray scanner, Z Backscatter Van, was also partially funded by OLAF. It was deployed in Dublin Port and is expected to remain there for at least 11 years. It allows for “unobtrusive and non-invasive cargo examinations” (Revenue Commissioners 2019b).

Drug-related cash seizures are undertaken by the Customs Service under Section 38 of the Criminal Justice Act, 1994, as amended by Section 20 of the Proceeds of Crime (Amendment) Act 2005 (see Section T1.1.4 of the *Legal framework workbook*). As stated in previous Drug markets and crime workbooks, most drug-related cash seizures are carried out when attempts are made to export from Ireland, but increasingly, seizures are also being made at the point of import and inland. These seizures continue to have a major impact on the activities of both national and international drug traffickers. Investigations are carried out throughout the EU and worldwide following a drug-related cash seizure. Cash forfeited under this Act is transferred for the benefit of the Exchequer.

Organised crime

As stated in previous Drug markets and crime workbooks, regional, national, and international organised crime and drug trafficking investigations are managed by the GNDOCB, which was established by AGS in 2015. It aims to disrupt, dismantle, and prosecute groups and individuals involved in serious organised criminal activity. A multidisciplinary approach is viewed as essential to target OCGs effectively via legislation such as the Proceeds of Crime Act, 1996, as amended in 2005 and 2016 (see Section T2.1 of the *Legal framework workbook*) and the powers of the CAB (Fitzgerald 2017, 30 March)

Moreover, numerous strategic partnerships are in place both nationally and internationally, and include the Revenue Commissioners Customs Service, HPRA, the Irish Naval Service, Europol, INTERPOL, and the Maritime Analysis and Operation Centre – Narcotics (MAOC-N) in Lisbon (Revenue Commissioners 2021) (Fitzgerald F 2016, 20 July).

Cross-border cooperation and collaboration continues between AGS, the PSNI, and other law enforcement agencies north and south of the border (Humphreys 2021, 8 July). The Fresh Start Agreement in 2015 created a Joint Agency Task Force led by AGS, the PSNI, the Revenue Commissioners, and Her Majesty’s Revenue and Customs in the UK, and which includes other relevant agencies, such as the National Crime Agency in the UK and the CAB. The aim was to build on existing law enforcement frameworks and to increase operational

effectiveness. Minister Flanagan notes that this has been successful in addressing cross-border criminality (Flanagan 2019, 19 November).

In addition, representatives from law enforcement agencies in the Republic of Ireland and Northern Ireland come together annually at the Cross-Border Conference on Organised Crime. The most recent event took place online on 17 December 2020. This was the 18th event. The theme was “understanding and preparing for the evolving cross border risks and threats around organised crime” after Brexit (Department of Justice) (Department of Defence 2020, 17th December). Minister McEntee said: “Criminal organisations and dissident groups cannot be allowed to take advantage of the UK’s separation from the EU. This webinar will allow us to better coordinate and understand the issues of cross border crime and identify the opportunities for beneficial cooperation in the context of new political realities...By better understanding the existing challenges and risks we can ensure they are managed and mitigated. This forum will be one step among many to ensure the communities of our shared island are safe from crime.” (Department of Defence 2020, 17th December). Minister Naomi Long commended “law enforcement agencies north and south of the border for their continuing commitment to working collectively to combat organised crime” (Department of Justice)

The conference is considered an essential and indispensable forum that enables discussion and information exchange which ultimately keeps communities north and south of the border safe (Department of Justice and Equality 2019) and allows for enhanced cooperation between law enforcement agencies. It also provides an opportunity to assess and address changing trends in crime and to build upon and enhance the operational actions already undertaken in this area. (Department of Justice). Agencies that attended the conference included AGS, the PSNI, the National Crime Agency, the Revenue Commissioners, Her Majesty’s Revenue and Customs, and relevant government departments from both the Republic of Ireland and Northern Ireland.

Policing communities

Drug-related crime in the form of gangland violence has become a serious problem in Dublin because of the ongoing feud between the Hutch and Kinahan criminal gangs, which are well known for robbery/burglary and for drug dealing, respectively. The GNDOCB is of the opinion that all associated killings are drug related, as they all stemmed from disagreements and revenge in relation to the illegal drug enterprise (personal communication, GNDOCB, 2018). The response to gangland violence that the AGS has established is coordinated under Operation Hybrid and is reviewed on a weekly basis in order to maintain optimal impact. As of 19 February 2021, in respect of DMR North Central Division, there have been 450 arrests associated with Operation Hybrid, with over 4,672 checkpoints performed, 1,3559 patrols and 74 searches (McEntee 2021, 24 February). Additionally, there are several other operations that are targeting OCGs in Ireland:

- As part of the National Garda Anti-Drugs Operation that commenced 01 July 2021, Operation Tara targets street-level dealing in cities, towns, and villages across Ireland. The main goal of Operation Tara is to protect communities from the ‘scourge of illegal drugs’ by disrupting, dismantling, and prosecuting drug trafficking networks at all levels, international, national, local, in all aspects of drug related activities. This operation was not affected by emergency measures responding to Covid (An Garda Síochána 2021. 1 July).
- Operation Jaywalk targets OCGs that are suspected of skimming, cashing out and money laundering.

- Operation Omena targets a Romanian OCG whose nationals are suspected of operating in Ireland. This is a joint investigation with enforcement agencies in Finland and with the assistance of Europl and Eurojust (An Garda Síochána 2020).
- Operation Stratus has been targeting organised crime in Co Louth. Support is provided by Emergency Response Units and Armed Support Units, which form part of the Special Tactics and Operations Command (STOC) (An Garda Síochána 2018) (An Garda Síochána 2019b).

Drug-related intimidation and violence is an area of major concern for Irish communities, and it has been shown to affect the physical, mental, and emotional well-being of victims (Connolly and Buckley 2016). Further details on this study can be found in Section T1.3.1 of *Focal Point Ireland: national report for 2016 – Drug markets and crime* (Health Research Board. Irish National Focal Point to the European Monitoring Centre for Drugs and Drug Addiction 2017).

The national Drug Related Intimidation Reporting Programme was developed by AGS with the aim of addressing the needs of drug users and family members who are subjected to drug-related intimidation. This programme fulfils criteria put forward in the most recent national drugs strategy in Ireland, *Reducing Harm, Supporting Recovery: A health-led response to drug and alcohol use in Ireland 2017–2025*, in Objective 4.1 of Goal 4: “Strengthen the resilience of communities and build their capacity to respond” (p. 63) (Department of Health 2017). See also *Focal Point Ireland: national report for 2017 – Drug policy* (Irish National Focal Point to the European Monitoring Centre for Drugs and Drug Addiction 2018b).

As stated in previous workbooks, primary responsibility for responding to the issue of drug-related intimidation has been given to one Inspector in every Garda division. Inspectors are at management level and are chosen by the Garda Commissioner for their expertise, knowledge, and extensive experience. They liaise directly with their local Superintendent in relation to each individual case. Anyone requiring help from an Inspector in their local area can make contact to arrange a formal or informal meeting. AGS is the lead agency working alongside the National Family Support Network (NFSN). Additional details of the operation of this programme are provided on the websites of both AGS and the NFSN at www.garda.ie and www.fsn.ie.

Reducing reoffending

As stated in previous workbooks, reducing reoffending is addressed via several agencies, such as the Irish Youth Justice Service, the IPS, AGS, and the Probation Service.

On 15 April 2021 the Minister for Justice, Helen McEntee, and the Minister of State for Law Reform, James Brown, launched a new Youth Justice Strategy 2021-2027 (Department of Justice 2021, 15 April). Section T3.1 of the *Legal Framework workbook*, provides an outline of the aim and guiding principles and main themes that underpin the strategy. In addition, the Probation Service aims to reduce the likelihood of reoffending by developing positive professional relationships via individual risk and needs assessment, combined with using interventions that are tailored to the individual’s needs. In order to achieve these goals, it avails of risk assessment and a risk-based approach to supervision (Probation Service 2020) (Probation Service 2021) gar.

c) Organisational structures/coordinating bodies

As reported in previous workbooks, responsibility for the prevention of drug trafficking rests primarily with the Revenue Commissioners Customs Division, whereas responsibility for the prevention of drug-related crime within Ireland rests primarily with AGS. In addition to the exchange of information between the Office of Customs Drugs Law Enforcement Head and the GNDOCB, which is part of AGS, nationwide liaison also takes place at local level between nominated Customs officers and Garda officers. Other State agencies

engaged in supporting supply reduction activities include the CAB and FSI. The Naval Service and the Air Corps cooperate with the Revenue Commissioners Customs Division and AGS, when called upon, through the Joint Task Force on Drugs Interdiction.

The Revenue Commissioners Office of Customs Drugs Law Enforcement, Investigations and Prosecutions Division

Revenue Commissioners Customs officers have primary responsibility for the prevention, detection, interception, and seizure of controlled drugs being smuggled into or out of Ireland. All strategic management functions relating to drugs issues are attached to the Investigations and Prosecutions Division (personal communication, Revenue Commissioners Press and Media Division, 2019), and include:

- Gathering national and international intelligence and disseminating this intelligence as necessary.
- Participating in the National Inter-Agency Drugs Joint Task Force, comprising the Revenue Commissioners Customs Division, AGS, and the Naval Service. Information is also exchanged between Customs Drugs Law Enforcement and the GNDOCB.
- Analysing national and international drug smuggling trends.
- Researching, planning, and organising both national and international operations targeting drug smuggling and related issues.
- Liaising with other national and international enforcement agencies and government bodies, as well as organising and participating in operations at both national and international level, including joint interagency operations.
- Participating in the International Liaison Network; five officers from the Investigations and Prosecutions Division are currently assigned abroad and are directly involved in the international exchange of information and intelligence. Officers are assigned to Permanent Representation in Brussels (2), the Irish Embassy (1), Europol (1), and the MAOC-N based in Lisbon (1).
- Managing the Revenue Commissioners Customs Division Memorandum of Understanding (MOU) initiative, which is a programme of cooperation between the Revenue Commissioners Customs Division and the business community on the prevention of smuggling, in particular drug smuggling. The Revenue Commissioners Customs Division has established working links with thousands of diverse companies, ranging from airlines, air express couriers, and shipping companies to airport and harbour authorities, freight forwarders, exporters, road hauliers, chemical companies, and yachtsmen. The MOU initiative delivers training to company staff by Customs liaison officers in order to heighten drug smuggling awareness, and practical advice is offered in order to help prevent vehicles from being used to smuggle drugs and other contraband goods. In addition, company staff are provided with ready channels of communication with the Revenue Commissioners Customs Division.
- Managing the Customs Drugs Watch Programme. The Revenue Commissioners Customs Division is responsible for monitoring 3000 km of coastline, and therefore individuals living in coastal communities, maritime personnel, and yachting networks are asked to contact Customs Drug Watch if they see any of the following activities:
 - “yachts and other craft sighted in remote areas
 - crew making landings in remote areas

- unusual objects at sea, underwater or ashore such as buoys or signaling devices
- merchant shipping at anchor close to land or islands
- ships away from their normal shipping lanes
- ships signalling ashore or being met by small craft
- vessels operating at night without lights” (Revenue Commissioners 2021)
- Managing the Drug Precursor Programme, which is a mechanism for cooperation between the Revenue Commissioners Customs Division and the chemical industry and was set up in order to detect the diversion of chemicals for illicit purposes. The Programme is designed to increase the awareness of Customs officers and members of the chemical trade to the possibility of legitimate chemicals being diverted to the manufacture of illegal drugs. As part of this programme, the Customs Service now has dedicated Precursor Liaison Officers located in key areas around Ireland. These officers have been trained in the identification and handling of chemicals and are tasked with liaising with members of the chemical trade for the purpose of identifying suspicious activity.
- Managing the Revenue Commissioners Customs Division detector dog teams which are operational and located nationwide.

2020: National Level Overview

In 2020, the Revenue Commissioners worked closely with other agencies internationally and in Ireland, including AGS, the CAB, the Defence Forces, the Naval Service, and the HPRA, sharing operational/intelligence support in order to act against the illegal drugs trade.

The Revenue Customs Drug Law Enforcement Unit was involved in 60 joint national operations and investigations with AGS – in particular with the GNDOCB. Overall, 40 individuals were arrested in 60 joint controlled deliveries in 2020, compared with 68 in 2019 (Revenue Commissioners 2021). In addition, Revenue Commissioners were involved in a range of other activities nationally:

- Worked closely with AGS, CAB, the Naval Service, and the Defence Forces, providing mutual operational, intelligence and materialsupport.
- Contributed to the national response in tackling organised crime, including the secondment of 17 staff members to the CAB.
- Participated in the Oversight Forum on Drugs, led by the Department of Health, which oversees the implementation of Government’s National Drugs Strategy 2017-2025.
- Joint Investigation Units (JIUs) worked closely with certain Government Departments and other agencies, including the Department of Enterprise Trade and Employment Special Investigations Unit and the Workplace Relations Commission, to confront and disrupt shadow economy activities. This effective and targeted collaboration produces significant results in terms of monitoring compliance with tax, PRSI and workers’ rights.
- Coordinated the enforcement and interception of prohibited and restricted goods and products on behalf of our colleagues in the Department of Agriculture, Food and the Marine, the Food Safety Authority of Ireland, the Department of Enterprise Trade and Employment, HPRA and the Competition and Consumer Protection Commission.
- Collaborated with the Private Security Authority (PSA) in exchanging information, in accordance with the Private Security Services Act, 2004, as amended, and the Taxes

Consolidation Act, 1997 to support the regulation of the private security industry.

- Worked closely with the Department of Justice on administrative matters related to Sheriff appointments (Revenue Commissioners 2021)

2020: International Level Overview

- Worked with international bodies and agencies and participate in the EU's Customs Cooperation Working Party. We have seconded officers to EUROPOL
- Worked in The Hague, the Irish Embassy in the UK and the Maritime Analysis and Operational Centre-Narcotics (MAOC-N) which is based in Lisbon.
- In line with strategic objective to work with partners to meet international challenges, and to build internal capacity and expertise in the international arena, in 2020, staff were seconded members to certain international organisations, including roles such as SNE to Directorate General TAXUD of the European Commission, Customs Attaché in the Perm Rep of Ireland to the EU and Perm Rep of Ireland to the EU. Staff members were also seconded to the UN SECCO for the duration of Ireland's term on the Security Council.
- Participated in several programmes under the European Multidisciplinary Platform Against Criminal Threats which is managed by Europol and coordinated at national level by An Garda Síochána.
- Engaged with the activities of the World Customs Organisation (WCO) directed towards addressing the threats posed by fraud and smuggling.
- Worked cohesively with the HPRA and AGS in the area of illicit medicines enforcement and, at the invitation of the WCO, gave an in-depth presentation on our interagency cooperation in this area at a Pangea (Illicit Medicines) conference in Brussels, which was attended by delegates from 48 countries and a range of law enforcement agencies.
- Worked closely with the European Anti-Fraud Office, sharing intelligence and information, and investigating irregularities involving evasion of duty on imports into the EU, including common customs tariff, anti-dumping duty and countervailing duty.
- Worked closely with Her Majesty's Revenue and Customs (HMRC) and other law enforcement agencies in Northern Ireland. The cross jurisdictional Joint Agency Task Force, established under the Fresh Start Agreement, prioritises the area of fiscal fraud. Under this framework, we work with the Police Service of Northern Ireland, An Garda Síochána, HMRC, the CAB, and the National Crime Agency.
- Key partner at the annual Cross Border Crime Conference, a collaborative event between representatives of law enforcement agencies and related organisations in the field of combatting organised crime on both sides of the border.

Worked closely with the Department of Justice and Equality (DJE) in relation to the implementation of the EU Passenger Name Record Directive which assists in the prevention, detection, investigation, and prosecution of terrorist offences and serious (Revenue Commissioners 2021).

An Garda Síochána

As reported in previous drug markets and crime workbooks, supply reduction activities range from participation in international and cross-border operations to street-level policing of supply and possession offences, to undercover operations targeting specific individuals or groups or targeting specific locations, such as nightclubs, where drugs are consumed.

The GNDOCB manages regional, national, and international drug trafficking and organised crime investigations. The main areas of focus are crime detection, supply reduction, harm prevention, demand reduction, and recovery support (An Garda Síochána 2021). It aims to disrupt, dismantle, and prosecute groups and individuals involved in serious organised criminal activity using intelligence-led investigations (An Garda Síochána 2021). It is also one of the lead agencies involved in implementing the current national drugs strategy. It is responsible for putting initiatives and policies in place that enable government strategies to lower the demand for drugs and decrease harms linked with their misuse (An Garda Síochána 2021).

Criminal Assets Bureau

As reported in previous National Reports, the CAB's statutory remit under the Criminal Assets Bureau Acts 1996 and the Proceeds of Crime Acts 1996–2016, and in social welfare and revenue legislation is to carry out investigations into the suspected proceeds of criminal conduct. The CAB uses a multi-agency, multidisciplinary partnership approach in its investigations into the suspected proceeds of criminal conduct. CAB staff are drawn from AGS, the Office of the Revenue Commissioners (including Customs), the Department of Employment Affairs and Social Protection, and the Department of Justice and Equality. The CAB also works closely with international crime investigation agencies and has successfully targeted proceeds of foreign criminality.

The CAB supports the roll-out of the Garda Divisional Profiler programme by providing lectures, training, and expertise, with reference to targeting middle-ranking drug dealers and others benefiting by deriving assets from criminal activity. In turn, the CAB receives intelligence, information, and evidence from profilers.

In order to continue to identify and trace assets which are the proceeds of crime, and to present testimony before the courts, the CAB has established the Bureau Analysis Unit, adopted international best practices in forensic analysis, and adopted the use of enhanced training. Through making earlier or preliminary applications relating to lower-value assets, the CAB has begun to target more middle-ranking criminals. While this approach may not realise extensive financial returns, it demonstrates the CAB's ability to react to local community concerns.

Forensic Science Ireland

As reported in previous National Reports, the Drugs section of FSI (formerly known as the Forensic Science Laboratory) examines and analyses substances seized by AGS or Revenue Commissioners Customs officers, and sometimes by the Military Police, that are thought to contravene the Misuse of Drugs Acts 1977–2017. As shown in Section T2.1 of this workbook, the most common drug encountered in the FSI laboratory was cannabis herb, followed by cocaine, heroin, alprazolam, MDMA and Zopiclone. Moreover, the increase in NPS-type drugs and further changes to drugs legislation have led to an exponential increase in the variety of compounds submitted to the laboratory for analysis. As a result, hundreds of different compounds can be analysed by staff on an annual basis. Items that possibly come into contact with such substances – for example, weighing scales, knives, and equipment from clandestine laboratories – may also be examined to determine whether traces of a controlled substance are present. Several analytical procedures are used in the laboratory in order to determine whether a substance is a controlled drug, the most common of which is

gas chromatography coupled with mass spectrometry (GC/MS). The results of the analysis are issued with a certificate of analysis that is presented as evidence in court.

Joint Task Force on Drugs Interdiction

As reported in previous National Reports, the Joint Task Force on Drugs Interdiction (JTF) was established in 1993 as a government measure to improve law enforcement in relation to drug trafficking at sea. The JTF comprises members of AGS, the Revenue Commissioners, and the Naval Service (Department of Defence 2015). The JTF is convened whenever AGS and the Revenue Commissioners, which have primary responsibility in this area, review intelligence received and consider that a joint operation with the Naval Service and/or the Air Corps should be mounted. The Naval Service is legally empowered under the Criminal Justice Act, 1994 (as amended by the Criminal Justice (Illicit Traffic by Sea) Act 2003) to engage in drug interdiction operations. The Air Corps provides air support if required and, on occasion, may be requested to carry members of the Revenue Commissioners in an observational capacity for the purposes of monitoring vessels suspected of drug trafficking. The Air Corps provides an important intelligence-gathering capability when requested by the JTF. Intelligence for drug interdiction operations is provided by AGS and the Revenue Commissioners and via the international intelligence centre MAOC-N (Department of Defence 2015).

T2. Trends

T2.1 Short term trends (5 years)

Seizures

The number of drug seizures in any given period can be affected by such factors as law enforcement resources, strategies, and priorities, and by the vulnerability of traffickers to law enforcement activities. However, drug seizures are considered indirect indicators of the supply and availability of drugs (see Standard Table T13). Data for drug seizures are recorded independently by both the Revenue Commissioners Customs Division and AGS, and each will be presented separately below.

Revenue Commissioners Customs Division seizures

Information regarding all Revenue Customs seizures, including Revenue Customs drugs seizures, are held in the Revenue National Seizure Register on C-NET, which is a secure networked intelligence system. Only Revenue Commissioners seizures are recorded on this register. As set out in Table 16 in the Revenue Commissioners *Annual Report 2020*, drugs seizures are recorded by product type:

- cannabis (herbal and resin)
- cocaine and heroin
- amphetamines, ecstasy, and other (Revenue Commissioners 2021)

No further category breakdown is available. When a prosecution is pending, or presumptive field tests are not available, only samples are sent to FSI for analysis (personal communication, Revenue Commissioners Press and Media Division, 2017).

Drug interceptions by the Revenue Commissioners and joint operations in 2020 resulted in 15,714 seizures (4621 kg), which were estimated to be valued at €44.8 million. The number of seizures for cocaine and heroin intercepted in 2020 (161) was lower than those intercepted in 2019 (231). The overall weight of these seizures was estimated at 123 kg and had a value of €10.2 million. While the number of seizures was lower in 2020 the estimated product weight and value was nearly double 2019 figures (64 kg, €4.56 million) (Revenue

Commissioners 2021). In 2020, a total of 1,439 kg of cannabis (herbal and resin) with an estimated value of €28.6 million was intercepted in 5,053 separate seizures (Revenue Commissioners 2021). Notably, the number and estimated value of cannabis seizures was nearly three times higher than those reported in 2019. The highest number of seizures reported by Customs officers was for amphetamines, ecstasy, and other types of drugs (10,500). The estimated weight of these substances was 3059 kg, and they had an estimated value of €6 million (Revenue Commissioners 2021)

An Garda Síochána seizures

Only drugs seized by AGS for supply offences are sent to FSI for analysis. Figure T2.1.1 shows trends for total seizures and cannabis-related seizures between 2003 and 2020 (personal communication, FSI, 2021).

All drug seizures

The total number of drug seizures analysed by FSI increased from 5,299 in 2004 to a peak of 10,444 in 2007. Between 2008 and 2010, the number almost halved to 5,477. This decrease was followed by a slight increase in 2011 (6,014). An annual decrease occurred

between 2011 and 2015, with the 2015 figure showing the lowest number of seizures in a 12-year period. Following an increase of 52% (1,814) between 2015 and 2016, a slight decrease occurred in 2017 (2%). Between 2017 (5,199) and 2018 (3,630), FSI analyses decreased by 30%. The quantity of drug seizures analysed by the FSI in 2019 was more than three times higher than in 2018. In 2020, the total number of drug seizures analysed in 2020 (N=10,475) was nearly 10% lower than 2019 figures (N=11,578)

Cannabis

Cannabis-type seizures accounted for nearly 32% of all drug seizures (see Figure T2.1.1). Following a slight decrease between 2003 and 2004, seizures of cannabis-type substances increased from 2005 to reach a peak in 2008. Between 2008 and 2010, the number of such seizures decreased by approximately 60%. Although there was a 38% spike in seizures in 2011, an annual decreasing trend was evident between 2011 and 2015; 2015 figures were approximately 55% lower than those reported in 2011. One possible explanation for this outcome is that gardaí targeted the cannabis cultivation industry in numerous operations during that time frame. Between 2015 and 2017, an increasing trend was evident. While FSI analysis reduced by 21% between 2017 and 2018, the number of cannabis-type seizures in 2019 (3,071) was more than double the number analysed in 2018. While a slight increase was evident in 2020, it was very small (<.5%).

Figure T2.1.1 Trends in the total number of drug seizures and cannabis seizures, 2003–2020

Source: (personal communication, FSI, 2003–2021)

An examination of cannabis substances by type is shown in Figure T2.1.2. Cannabis herb has been shown to be the most prominent drug seized in Ireland since 2010. Between 2011 and 2015, there was an overall decrease in the numbers of cannabis herb, cannabis resin, and cannabis plants seizures. While number of cannabis herb and resin seizures analysed increased between 2015 and 2016, the figure illustrates that between 2016 and 2018, the number of seizures analysed for both substances decreased annually. However, between 2018 and 2019, a substantial increase was shown for the three main cannabis products analysed. In 2020, there was a slight increase in the analysis of cannabis herb seizures, and a larger increase was evident for cannabis plants. However, the analysis of cannabis resin decreased from 2019 (N=422) to 2020 (N=263).

Figure T2.1.2 Trends in the total number of drug seizures by cannabis type, 2006–2020

Source: (personal communication, FSI, 2007–2021)

* These figures are not a true reflection of the number of cannabis plants analysed, as only a sample of these seizures is sent for analysis.

As can be seen in Figure T2.1.3, analysis of percentage increases/decreases between 2011 and 2015 follow a similar trajectory as the total number of cannabis seizures. Overall, seizures showed a 56% increase between 2015 and 2016. Similarly, seizures of cannabis herb and resin increased by 67% and 56%, respectively. In contrast, this analysis shows that seizures of cannabis plants decreased by 9% between 2015 and 2016. A different picture emerged between 2016 and 2017; overall, there was a slight decrease in the analyses of cannabis-type seizures (6%). Similarly, the analysis by type indicates that seizures of cannabis herb and resin decreased by 12% and 14%, respectively. In contrast, a substantial increase (70%) was evident for seizures of cannabis plants. As stated previously, a possible explanation for this outcome is that operations by Irish law enforcement agencies have focused specifically on addressing the problem, resulting in arrests and convictions (personal communication, GNDOCB, 2016). However, it is also important to note that while the number of cannabis plants analysed has mainly been lower than the number of cannabis herb and cannabis resin samples, this is not a true reflection of how many cannabis plants are seized in Ireland each year, as only a sample of overall cannabis plant seizures are sent to FSI for analysis. Therefore, this outcome should be interpreted with caution. Between 2017 and 2018, cannabis plants (-60%) and cannabis resin (-32%) accounted for a larger proportion of the overall 21% decrease in cannabis-type seizures. Figure T2.1.3 shows the analysis of cannabis herb, resin, and plant seizures was significantly higher in 2019 when compared with 2018, however in 2020, total cannabis-type seizures analyses remained similar to 2019 figures. Further investigation of this indicated that while only a slight increase was evident for the analysis of cannabis herb, analysis of cannabis resin decreased by 38% and the analysis of cannabis plants increased by 41%

Figure T2.1.3 Comparison of percentage increase/decrease, total drug seizures, for cannabis-type products, by cannabis type, 2007–2020

In 2020, other types of cannabis products were seized and submitted for analysis (n=78). Tetrahydrocannabinol (THC) was detected in 68 seizures, and trace amounts of THC were found in one seizure. According to FSI, ‘trace amount’ generally means a very small amount of a substance in the presence of something else, or it might be the residue of a drug on tinfoil (personal communication, FSI, 2019). Cannabis oil (cannabidiol [CBD]) was found in 8 seizures, and 1 other seizure amount of both CBD and THC.

Other controlled drugs

Opioids

Heroin: Figure T2.1.4 shows trends for seizures of heroin between 2003 and 2019. From 2004, the number of heroin seizures analysed increased, reaching a peak in 2007 (1,698). Although heroin seizures subsequently decreased almost every year between 2007 and 2013, a substantial increase occurred between 2013 and 2014 (38%). Although an increase was evident between 2015 and 2016 (35%), decreases were shown from 2014 to 2015 (21%) and from 2016 to 2017 (25%), and an even larger decrease was shown between 2017 and 2018 (60%). The number of heroin seizures analysed in 2019 was more than four times higher than 2018. The number of diamorphine seizures analysed in 2020 was 21% lower than 2019.

In addition, FSI analysis determined that traces of diamorphine were present in 1 seizure in 2020 (see Figure T2.1.4).

Figure T2.1.4 Trends in the number of heroin seizures, 2003–2020

Source: (personal communication, FSI, 2003–2021)

Other opioids: Figure T2.1.5 shows trends in the number of other opioids seized between 2012 and 2020. Following a peak in the total number of seizures in 2014, the number of seizures of drugs in this category declined year on year, with the number of seizures in 2018 being approximately 77% lower than in 2014. However, in 2019, the total number of seizures analysed (N=66) was nearly four-and-a-half times higher than in 2018 (N=15). A slight increase was evident in 2020 (11%). Further analysis indicated that methadone was the most prominent drug in this category, accounting for nearly 56% of analyses in 2020 (see Figure T2.1.5). In 2020, other substances analysed included tramadol (9), oxycodone (8), codeine (6), morphine (4) and buprenorphine (3).

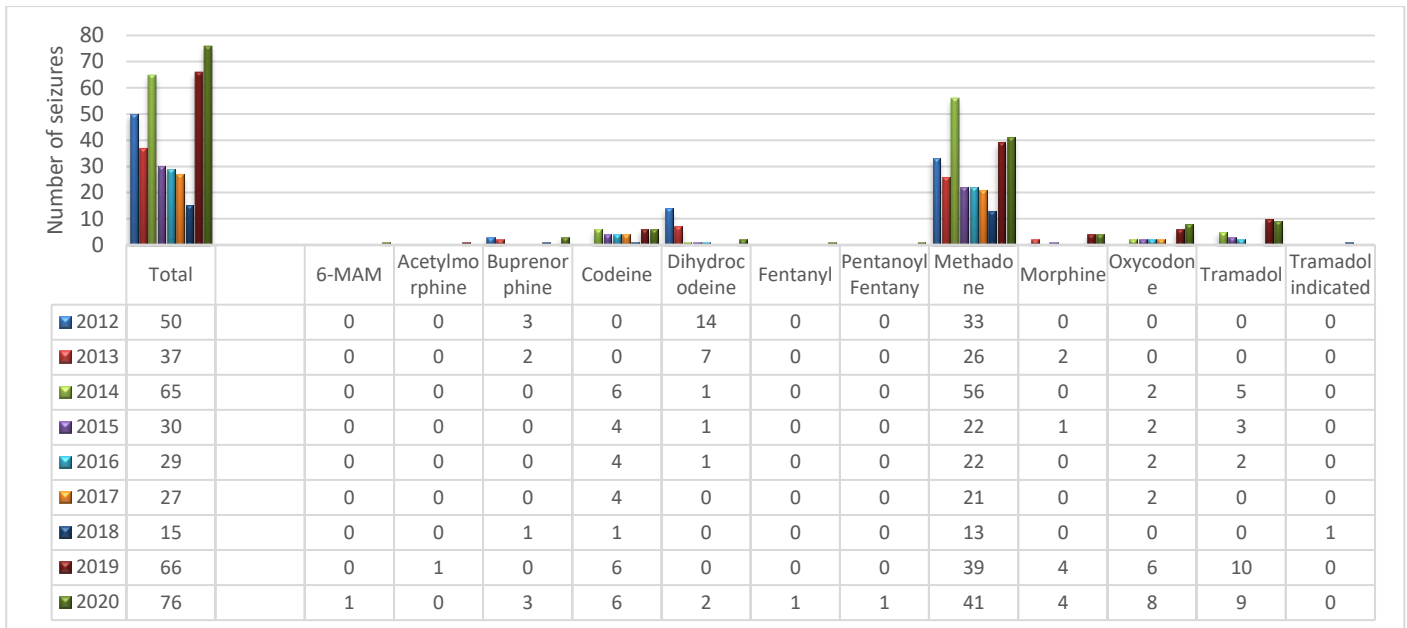

Figure T2.1.5 Trends in the number of seizures of other opioids, 2012–2020

Source: (personal communication, FSI, 2012–2021)

Cocaine: Figure T2.1.6 shows the trends for cocaine seizures between 2003 and 2019. Generally, except for a 11% spike between 2013 and 2014, the number of cocaine seizures decreased from a peak of 1,749 in 2007 to 364 in 2015. One possible explanation for this is that the economy in Ireland was not doing well in 2013 and 2014; another possibility is that the market would have been affected by the availability of cheaper white powders that mimic the effects of cocaine (personal communication, GNDOCB, 2016). An increase in cocaine analyses was seen in 2016 (63%) and 2017 (33%). Although a decrease of 25% was shown in 2018, this was followed by a substantial increase in 2019 (N=2231), when the number of cocaine seizures analysed was close to four times higher than in 2018 (N=595). The number of cocaine seizures analysed in 2020 was 11% lower than those analysed in 2019.

In addition, FSI detected cocaine along with other substances (N=7); diamorphine (2), MDMA (2), amphetamine (1), THC (1) and dimethylone (1).

Figure T2.1.6 Trends in the number of cocaine seizures, 2003–2020

Source: (personal communication, FSI, 2003–2021)

Stimulants other than cocaine: Table T2.1.1 shows a breakdown of the stimulants other than cocaine that were seized and analysed by FSI between 2012 and 2020. Between 2016 and 2018, there was a steady decline in analyses. However, in 2019, FSI analysed 1,303 stimulants other than cocaine; this was more than three times higher than 2018 figures. A decrease of 31% was shown in 2020.

As shown in Table T2.1.1, a breakdown by substance indicates that the most prominent substance in this category is MDMA, followed by amphetamine and methylamphetamine. Following a peak in 2013 (n=434), the number of MDMA seizures decreased until 2015 (n=202). Between 2015 and 2016, an increase of 71% was shown. Although the change between 2016 and 2017 was negligible, between 2017 and 2018, the analyses of MDMA seizures decreased by 12%. Data received from FSI have shown that the number of MDMA analyses in 2019 (n=974) was more than three times higher than in 2018 (n=304). A further decrease of 35% was illustrated between 2019 and 2020.

Following a steady decline between 2012 and 2015, the number of analyses of amphetamine seizures peaked in 2016 (n=104). Between 2016 and 2017, a decline of 40% was recorded. While a slight increase occurred in 2018 (8%), a further increase was shown in 2019 when the number of analyses carried out was more than three times higher than in 2018, and more than double the analyses reported in 2016 (n=104) (see Table T2.1.1). Between 2019 and 2020, the analysis of amphetamine seizures decreased by approximately 16%

As shown in Table T2.1.1, 33 methylamphetamine seizures were analysed by FSI in 2020, which was 39% lower than 2019 figures (n=54).

Hallucinogens: Figure T2.1.7 shows trends in the number of hallucinogen seizures between 2012 and 2020. Over the course of this time frame, a variety of hallucinogens have been seized, including acetylpsilocin, DMT, ketamine, lysergide, ALD-52, mescaline, psilocin, psilocybin, and salvinorin A. While the total number of hallucinogen seizures analysed ranged from 65 to 79 between 2016 and 2018, the number reported by FSI in 2019 (303) was more than four times higher than the number reported in 2018 (72). Between 2019 and 2020, to total number of seizures in this category decreased by 25%

The most predominant hallucinogen seized in 2020 was ketamine (n=169), which nearly 30% lower than the number of ketamine analyses in 2019 (n=240). This was followed by lysergide (n=31) and DMT (n=14).

Figure T2.1.7 Trends in the number of seizures of hallucinogens, 2012–2020

Note: *indicated can mean not controlled in Ireland at time of analysis, or a small amount of material present.

Hypnotic and sedative drugs: Another factor that may be influencing seizure trends for illegal drugs is the illegal street sale of prescription drugs. Table T2.1.2 shows trends for some of the main prescription drugs, primarily benzodiazepines and Z-hypnotics, seized by AGS and analysed by FSI in recent years. Following a peak in 2013 (N=861), the number of seizures of hypnotic and sedative substances decreased annually until 2016. A 73% increase in these seizures was recorded between 2016 and 2017, followed by a 49% decrease between 2017 and 2018. However, the number of seizures analysed in 2019 (N=1269) was more than four times higher than those reported in 2018 (N=309).

The most prominent drug in this category in 2020 was alprazolam, followed by zopiclone and diazepam, delorazepam, adinazolam and flualprazolam. Following the overall trend for this category between 2019 and 2020, alprazolam increased by 9%, and zopiclone increased by nearly 2%. Flualprazolam analyses were seven times higher than 2019. This is the first time that analysis for adinazolam (n=43) and delorazepam (n=62) have been reported.

NPS: Table T2.1.3 shows trends for NPS that are available on the Irish market. In 2020, 280 NPS were analysed by FSI. This figure nearly 29% lower than the number analysed in 2019 (388). The most prominent NPS in 2020 was etizolam (n=146), followed by diclazepam (n=31), and clonazepam (n=23).

Table T2.1.3 Seizures of NPS in Ireland, 2012–2020

Medicinal products: Table T2.1.4 shows a breakdown of medicinal products seized between 2012 and 2020. The number of medicinal products analysed by the FSI in 2020 (N=669), this was just over 6% lower than 2019 (n=714).

The main drug seized in this category in 2019 was benzocaine (n=225), which was slightly higher than 2019 (n=207). The most prominent substances after benzocaine included creatine/creatinine (n=92), paracetamol (n=35), pregabalin (n=32), paracetamol/caffeine indicated (n=25), sildenafil (n=23), and mirtazapine (n=19).

Table T2.1.4 Seizures of medicinal products in Ireland, 2012–2020

T2.2 Explanations of long-term trends and short-term trends in any other drug market data

No new information

T2.3 Short/long term trends in drug law offences data

Garda-recorded incidents of drug offences

Crime data, which are collated on the Police Using Leading Systems Effectively (PULSE) system by AGS, are provided to the CSO for analysis. An incident may consist of more than one criminal offence, and a primary offence or detection may refer to one offence within an incident. Sometimes, a charged offence may be different from the offence originally identified in the incident. Nevertheless, incidents are a useful indicator of the level of types of criminal activities (Central Statistics Office 2014).

In September 2017, due to issues with the quality of data received from PULSE, crime statistics were suspended by the CSO. In 2018, the CSO announced that publication of crime statistics would resume; however, as the quality of PULSE data was still under review, they would be published in a new category: 'under reservation'. Essentially, what this means is that the crime statistics are of sufficient quality to allow publication; however, due to the ongoing issues with PULSE data, the quality does not meet the higher standard required of official statistics by the CSO (Central Statistics Office 2018, 28 March). Therefore, the figures that are provided here may not be the same as those in previous years' reports and are likely to change in the future, as quality issues are resolved. What follows are the available statistics for recorded incidents of drug offences and court proceedings, as entered in the PULSE system by gardaí.

As Figure T2.3.1 shows, following a decline between 2008 and 2013, the total number of controlled drug offences recorded increased in 2014 (by 3%). Although a decline of 5% (from 15,861 to 15,047 offences) was recorded between 2014 and 2015, between 2016 and 2019 the number of drug offences recorded has increased annually, by 6% in 2016, 5% in 2017, 9% in 2018, 17% in 2020. Between 2019 and 2020, a 9% decrease was evident (CSO, 2021).

Figure T2.3.1 Recorded total number of controlled drug offences under reservation between 2003 and 2020

Source: CSO, 2021

Figure T2.3.2 Map showing An Garda Síochána administration boundary after 2019 restructuring

This section provides a breakdown of recorded incidents by region (see Figure T2.3.2). Figure T2.3.3 shows a breakdown of importation of drugs offences by region and year. It clearly illustrates that the highest number of controlled drug offences was recorded in the Dublin Metropolitan Region (DMR). Moreover, recorded offences in DMR have been increasing since 2017. Most regions showed an increase in the number of incidents reported between 2019 and 2020 except the Eastern Region which showed a 15% decrease. The greatest increase was shown in the North Western Region (22%), followed by the Southern Region (20%) and DMR (16%).

Figure T2.3.3 Recorded incidents of controlled drug offences, categorised by region, 2003–2020

Source: (personal communication, CSO, 2021)

Supply: Recorded incidents

Figure T2.3.4 shows the number of controlled drug offences by importation, and by cultivation or manufacture of drugs, recorded under reservation between 2003 and 2020.

Importation of drugs

Essentially, from 2003 to 2020, an increase/decrease trend has been evident for recorded importation of drugs incidents. Increases were seen between 2005 and 2008 (86%), 2010 and 2011 (38%), 2012 and 2013 (47%), and 2015 and 2016 (47%). Incidents recorded in 2019 were nearly double the number recorded in 2018. Decreases were seen between 2008 and 2010 (57%), 2011 and 2012 (25%), 2013 and 2015 (57%), 2016 and 2017 (25%), 2017 and 2018 (29%) and 2019 and 2020 (25%).

Cultivation or manufacture of drugs

As shown in Figure T2.3.4, recorded incidents of the cultivation or manufacture of drugs increased steadily after 2004 and peaked in 2011. Alarmingly, between 2006 and 2010, the number of offences recorded increased nearly six-fold. A 9% increase was shown between 2010 and 2011. Between 2011 and 2015, there was a steady decline in the number of such incidents reported; 2015 figures were nearly 60% lower than 2011 figures. Although an increase was shown between 2015 and 2016 (9%), the number of recorded offences has declined annually since then; a decline of 5% was evident between 2016 and 2017, and a larger decline was evident between 2017 and 2018 (19%). The decreasing trajectory continued in 2019 with a 4% decrease from 2018 (see Figure T2.3.4). Between 2019 and 2020, the number of offences recorded for cultivation and manufacture of drug offences doubled.

Windle (2017) argued that changes in trends between 2010 and 2012 could be explained by: a) emigration, due to higher levels of young people who consume drugs leaving Ireland during the recession; or b) adaptation, where dealers and consumers adapted to having less income by growing their own product, which resulted in the decline in drug importation (Windle 2017). Further information on this study can be found in Section T4.1 of this workbook. In addition,, trends have also been impacted by operations by Irish law enforcement agencies that have specifically targeted drug crimes in recent years.

Figure T2.3.4 Recorded incidents of controlled drug offences categorised by importation of drugs, and by cultivation or manufacture of drugs, 2003–2020

Source: CSO, 2021

Supply: Recorded incidents by region

This section provides a breakdown of recorded incidents by region. Figure T2.3.5 shows a breakdown of importation of drugs offences by region and year between 2003 and 2020. It clearly illustrates that the highest number of importation of drugs offences was recorded in the DMR. While the number of incidents recorded between 2016 and 2018 decreased annually, this trend changed in 2019, where incidents recorded (n=20) was more than double the number recorded in 2018 (n=9). Between 2019 and 2020 a slight decrease was shown (N=3).

Figure T2.3.5 Recorded incidents of importation of drugs offences, categorised by region, 2003–2020

Source: (personal communication, CSO, 2021)

Figure T2.3.6 presents the frequency of recorded incidents of cultivation or manufacture of drugs offences by region from 2003 to 2020. Overall, increases were reported in all Regions in 2020. The Southern Region reported the highest number of incidents and the DMR reported the lowest number of incidents.

Figure T2.3.6 Recorded incidents of cultivation or manufacture of drugs offences, categorised by region, 2015–2020.

Source: (personal communication, CSO, 2021)

Possession of drugs for sale or personal use: Recorded incidents

Figure T2.3.7 shows the number of recorded incidents under reservation for possession of drugs for sale or supply and for personal use.

Possession of drugs for sale or supply

The number of recorded offences of possession of drugs for sale or supply nearly doubled between 2004 (N=2183) and 2008 (N=4265). A steady decline was seen overall between 2008 and 2013, except from 2009 to 2010, which showed a 3% increase. Since 2013, the number of incidents recorded increased by 10% in 2014, followed by a 5% decrease in 2015. An increase in incidents of possession of drugs for sale or supply was shown annually from 2015 to 2016 (8%), 2016 to 2017 (6%), 2017 to 2018 (8%), 2018 to 2019 (16%) and 2019 to 2020 (26%).

Possession of drugs for personal use

The number of incidents recorded of possession of drugs for personal use peaked in 2008 (N=18 075). This figure was nearly three times higher than that recorded in 2003. A decreasing trend was seen between 2008 and 2013. Since 2013, incidents recorded of possession of drugs increased in 2014 (1%, 85 more incidents) before decreasing again in 2015 (3%, 317 fewer incidents). Between 2016 and 2019, reported incidents have increased annually, by 4% in 2016, 7% in 2017, 10% in 2018, 17% in 2019 and 2% in 2020 (see Figure T2.3.7).

A possible explanation for the recent annual increases in the number of drug offences recorded is that both supply and possession of drugs have increasingly been the target of focused operations by gardaí and other agencies in recent years.

Figure T2.3.7 Recorded incidents of controlled drug offences, categorised by possession for sale or supply or by possession for personal use, 2003–2020

Source: CSO, 2021

Possession of drugs for sale or for personal use: Recorded incidents by region

As shown in Figure T2.3.8, between 2003 and 2020 most recorded incidents for possession of drugs for sale or supply occurred in the DMR. Between 2019 and 2020, all regions experienced increases in incidents recorded; the largest increase was in the North Western Region (46%), followed by the Southern Region (44%), the DMR (20%) and Eastern Region (15%).

Figure T2.3.8 Recorded incidents of possession of drugs for sale or supply offences, categorised by region, 2003-2020

Source: (personal communication, CSO, 2021)

Similar to Figure T2.3.8, Figure T2.3.9 also indicates that the highest number of recorded incidents of possession of drugs for personal use occurred in the DMR. Three regions experienced an increase in the number of incidents recorded between 2019 and 2020; North Western Region (14%), followed by the DMR

(12%) and the Eastern Region (11%). The number of recorded incidents of possession of drugs was lowest in the North Western Region in 2020.

Figure T2.3.9 Recorded incidents of possession of drugs for personal use offences, categorised by region, 2015–2020

Defence Forces

As stated in Section T1.1.4 of the *Legal framework workbook*, compulsory random drug testing (CRDT) and targeted drug testing have existed for Defence Forces personnel (the Army, the Air Corps, the Naval Service, and the Reserve) since 2002 and 2009, respectively. Table T2.3.1 shows the total number of personnel who were tested between 2009 and 2020 (Kehoe 2017, 11 April) (Department of Defence 2020) (Department of Defence and Defence Forces 2021). Table T2.3.2 shows a breakdown by organisation between 2015 and 2020 (Department of Defence and Defence Forces 2021) (Department of Defence 2020) (Department of Defence 2019) (Department of Defence 2018) (Department of Defence 2017). In 2020, CRDT operations were constrained due to Covid-19 national restrictions, nonetheless, the Defence Force drug testing team carried out 762 random drug tests in different locations (N=10), of which, 11 were positive representing 1.54% of those tested.

At the start of 2020, five Defence Forces personnel were in the targeted drug testing programme, and one more joined the programme through the year. Overall, 16 targeted tests were carried out during the testing period. Of these personnel, three finished the process and remained in service, one tested positive for controlled drugs and proceeded to be ‘Discharged by Purchase’. In December 2020, two personnel remained in the targeted drugs testing process (Department of Defence and Defence Forces 2021)

Table T2.3.1 Details of compulsory random drug tests, 2009–2020

Year	Total tested	Negative tests	Positive tests

* Data for positive tests by location were not provided in 2015.

** Including two positives in 2018 under the heading “Failure to Report”.

T2.4 Other drug offences

Other drug offences

The category ‘possession/supply drug offences, drug-related crime’ also has a classification for other drug offences, which includes forged or altered prescription/obstruction offences.

Forged or altered prescription/obstruction offences under the Misuse of Drugs Acts 1977–2017

Following a peak in 2009 (N=824), the number of other drug offences recorded decreased annually until 2011. Between 2011 and 2012, the number of incidents recorded increased by 10%. Offences recorded declined between 2012 and 2013 by nearly 16%, before increasing by 39% between 2013 and 2014. Although a substantial decrease (27%) was shown in this category between 2014 and 2015, crimes recorded increased by 44% from 494 in 2015 to 713 in 2016. While incidents recorded in this category decreased in 2017 (31%), since then the number of incidents recorded has increased annually, by 10% from 2017 to 2018, by 32% from 2018 to 2019 and by 34% from 2019 to 2020 (see Figure T2.4.1).

Driving under the influence of drugs

Driving under the influence of drugs has been a statutory offence in Ireland since the enactment of the Road Traffic Act, 1961. The number of offences of driving under the influence of drugs peaked in 2009 (N=873). A decreasing trend for this offence was evident between 2009 (N=873) and 2016 (N=217). Since 2016, the

number of offences recorded has increased annually, by 29% between 2016 and 2017 and by 88% between 2017 and 2018. In 2019, the number of incidents recorded was nearly two-and-a-half times higher than the number recorded in 2018 (see Figure T2.4.1) (CSO, 2021). This increase was not surprising; due to provisions in the Road Traffic Act 2016, preliminary roadside drug testing by AGS commenced in Ireland in April 2017. However, the number of incidents recorded in 2020 (N=2646) was double that reported in 2019(N=1263).

Further information on the Road Traffic Act 2016 can be found in Section T3.1 of the *Legal framework workbook*.

Figure T2.4.1 Recorded incidents of other drug offences and driving under the influence of drugs under reservation, 2003–2020

Note: Other drug offences include forged or altered prescription offences and obstruction under the Misuse of Drugs Acts 1977–2017.

Source: (CSO, 2021)

By region

Figure T2.4.2 presents the frequency of recorded incidents for driving or being in charge of a vehicle while under the influence of drugs by region between 2003 and 2020. Since 2015, the data indicates that the frequency of incidents reported has increased annually with the highest increase shown in 2020. DMR was the highest, follow by North Western Region and Eastern Region. In 2020, the Southern Region recorded the lowest number of incidents (n=580). As stated above, a possible explanation for the recent annual increases is that in April 2017, a new measure to address this offence was introduced: roadside drug testing. Gardaí have been given power to carry out Preliminary Drug Testing (PDT) using the Dräger Drug Test 5000 device (and, more recently, the Dräger Alcotest 7510) on motorists who are thought to be driving under the influence of drugs (Sheehan 2019). The device tests the driver’s oral fluid (saliva) for the presence of cannabis, cocaine, opioids (such as heroin or morphine) and benzodiazepines (such as valium).

Figure T2.4.2 Recorded incidents of driving/being in charge of a vehicle while under the influence of drugs, categorised by region, 2003–2020

Source: (personal communication, CSO, 2021)

Roadside drug testing

Drug driving is still an issue in Ireland; however, no new data is currently available.

T2.5 Notable trends or important developments in the organisation, coordination, and implementation of drug supply reduction activities over the past 5 years

See Section T1.3.1 for an overview of recent developments in the organisation and coordination of supply reduction activities.

T3. New developments

T3.1 New or topical developments observed in the drug market in Ireland since 2015

Please see Section T3.1 of the *Drug policy workbook*, which provides an outline of recent developments that will likely have an impact on the Irish drug market in the future. Areas discussed include:

- Focused policy assessment on Ireland’s national drugs strategy
- Drug policy changes in response to the COVID-19 pandemic
- Updates on implementation of the Public Health (Alcohol) Act 2018
- Health Diversion Approach to possession of drugs for personal use
- Establishment of a pilot supervised injecting facility.

T3.2 Describe any other important aspect of drug market and crime that has not been covered in the specific questions above (optional)

T4. Additional information

T4.1 Specific studies

No specific studies

Lifting the lid on Bluetown and Redtown

On 27 January 2021, Minister for Justice Helen McEntee TD launched ground-breaking research carried out by the Research Evidence into Policy Programmes and Practice (REPPP) Project team at the University of Limerick. Overall, there were three reports: *Lifting the lid on Bluetown* (O'Meara Daly, *et al.* 2020) *Lifting the lid on Redtown* (Naughton, *et al.* 2020), and a national prevalence study.³ This article presents a synthesis of the Bluetown and Redtown studies (O'Meara Daly, *et al.* 2020); (Naughton, *et al.* 2020).

Background

The Bluetown and Redtown studies are two replication case studies carried out to determine whether the findings of the Greentown study could be generalised to other locations in Ireland (Redmond and Naughton 2017); Department of Children and Youth Affairs, 2016}. The original Greentown study in 2016 examined the effect of a criminal network on offending behaviour of children (Redmond and Naughton 2017); Department of Children and Youth Affairs, 2016}. The results of this study indicated that a criminal network was in operation in Greentown and responsible for enabling increased criminal activity in children in this area. Five main findings emerged in the Greentown study:

- 1 A criminal network existed and contained key network actors.
- 2 The network was hierarchical in nature.
- 3 The hierarchical structure was supported by powerful processes and a sympathetic embedded culture.
- 4 Power and influence were mediated by geography, obligation, and the intensity of the relationships with patrons.
- 5 The network compelled some children in the area into abnormal patterns of offending behaviour (Naughton, *et al.* 2020); (O'Meara Daly, *et al.* 2020).

Aims of replication study

The aim of the replication case studies was to determine what factors influence young people's engagement and retention within a criminal network and how these factors may influence their crime trajectories. The main research questions addressed in this study included:

- 1 From the Garda respondents' perspective, what are the factors that influence young people's engagement and retention within the Bluetown/Redtown criminal network?
- 2 How do members of An Garda Síochána portray the influence of engagement in the Bluetown/Redtown network on young people's patterns of crime?

Methodology

Similar to the Greentown study, the Bluetown and Redtown studies were centred on a case study design and consisted of the following sequential steps:

- Burglary and drugs for sale and supply detection data for offences committed by young people (aged <18 years) and collated on An Garda Síochána's PULSE (Police Using Leading Systems Effectively) system between 2014 and 2015 were analysed and ranked.
- A criminal network map was developed by Garda analysts using the PULSE data and illustrated how offenders who carried out burglary or drugs for sale and supply and robbery offences between 2014 and 2015 in Bluetown linked together via common offences.

- To ensure anonymity of individuals on the criminal network map, Twinsight methodology developed for the Greentown study was utilised.⁴ Two versions of the map were developed: a ‘live’ version and a ‘researcher’ version. The live version contained personal details of the offenders involved and was only seen by Garda members or analysts. The second version, a researcher version, was similar to the first version, except there was no identifying or personal information and was used only by the researcher. The maps shared unique identifier codes, which allowed Garda respondents (n=16) taking part in semi-structured interviews to ‘ground’ (p. 24) their views by linking real events to the individuals on the map via the unique identifier.⁴
- Garda respondent interviews focused on network members and contexts and were embedded in specific events.
- Transcribed interviews were imported into NVivo software, where they were coded and analysed.
- Two quantitative diagnostic tools were used to identify and develop case profiles of significant members within the network.
- The themes found increased the understanding of how the network operated.

Bluetown study

Findings

Bluetown was a large urban Garda subdistrict (O'Meara Daly, *et al.* 2020). Findings from the Bluetown study were grounded in Garda narratives and centred mainly on their significance to the research questions. Three key findings emerged from the analysis.

Finding 1: Four area-based criminal networks existed in Bluetown that were distinct from each other.

Of the four criminal networks identified, three were operational (Area A, Area B[n=2], and Area C). Individuals living in Area D were no longer considered involved in crime. The criminal network map was adapted to show key differences between locations and networks that emerged in Garda narratives. Bluetown covered a larger area than the Greentown and Redtown studies. The impact of this was that Garda respondents could only provide information regarding areas they patrolled. Table T4.1.1 shows a summary of networks and some of their key characteristics (O'Meara Daly, *et al.* 2020).

Table T4.1.1: Summary of Bluetown network characteristics

Themes	Network	Characteristics
Area A	Network 1	<ul style="list-style-type: none"> • Family based and hierarchical in nature and has existed for generations • Led by husband-and-wife team, B46 and B55 • Members included their sons (B54 and B56) and extended family (B43, B44, B45, B47, B48, B53) • Focused on property crime • Considered a ‘massive organisation’ (p. 22) • Proceeds of crime given to the family • Network was structured with a level of organisation • Viewed as intergenerational career criminals
Area B	Network 2	<ul style="list-style-type: none"> • Emerging crime gang centred on five members (B11, B7, B5, B12 and B5) living near each other • No family ties • Centred on peer and ‘associate’-based relations (p. 27)

Themes	Network	Characteristics
		<ul style="list-style-type: none"> Initially committed minor offences, moved on to more complex burglaries and assault and robbery as they aged 3/5 members serving long prison sentences at time of study
Area B	Network 3	<ul style="list-style-type: none"> Highest level of burglary detections Consisted of five core members who grew up together (B21, B19, B17, B20 and B10) Responsible for violent and aggravated burglaries Internal group friendship and trust sustained network in the area Considered a 'dangerous crew' (p. 29) 4/5 members (B21, B10, B17 and B19) were in prison at time of study
Area C	Network 4	<ul style="list-style-type: none"> Close-knit group of friends who lived near to one another Those involved included retail-level drug street dealers, those carrying the drugs, those vulnerable, and those at risk of being caught G24, the network's leader, did not exist on the network map
Area D	–	<ul style="list-style-type: none"> Individuals no longer participated in serious or atypical crime except for one (B29) Information emerged via a common robbery incident Desistance from crime evident

Source: O'Meara Daly, Redmond, and Naughton (2020)

Finding 2: A combination of risk factors was linked to young people developing more serious and prolific offending patterns across all networks.

A thematic analysis showed a relationship between 'shared common risk factors' and 'more serious and prolific offending patterns' in all identified networks (p. 39).¹ There were four subthemes:

- Family ties to crime
- Proximity to a network of offending peers
- Individual risk factors
- Pro-criminal norms.

Finding 3: Criminal network strength and stability was enhanced by the quality of 'trust' in relationships between members and influenced by fear and intimidation.

Based on thematic analysis, relationship strength between network members was shown to have varying levels; higher levels of trust contributed to greater network stability, as shown in Figure T4.1.1.

- Network 1 is strongest with regard to relationship strength and network stability.
- Networks 2 and 3 were centred on co-offending relationships that emerged from living near to each other and other risk factors.
- Network 4 was centred on a drugs hierarchy and utilised a more organised structure.
- Fear and intimidation contributed to the strength and stability of Bluetown networks.

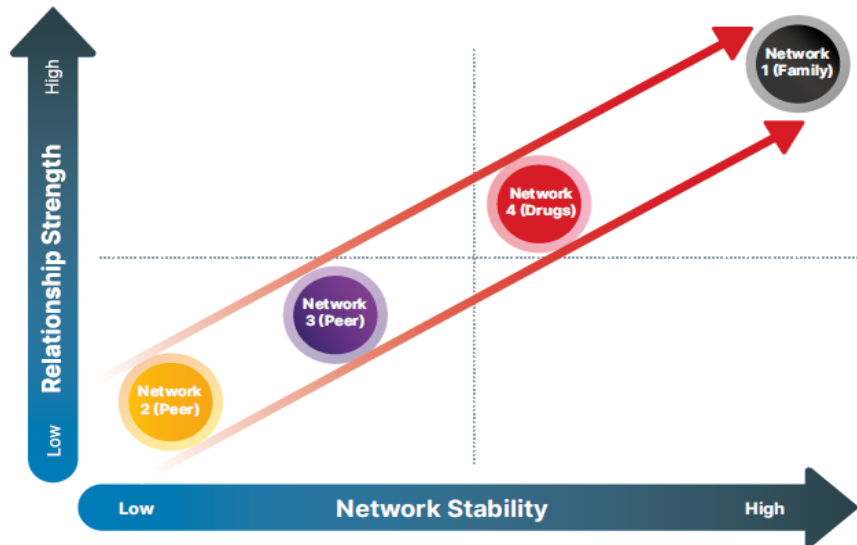

Figure T4.1.1: Network position from low strength and stability to high

Source: Figure 11 extracted from O’Meara Daly, Redmond, and Naughton (2020), p. 43

Strengths and limitations

There were several strengths and limitations to the study. The findings in this study were centred on third-party observations and perspectives. The Twinsight methodology developed in the Greentown study allowed for in-depth knowledge and context to be captured. However, there were challenges, as the area covered by Bluetown was a large urban area. As a result, knowledge reported by Garda respondents was limited and centred on their own patrol or catchment area; hence, some information on offenders was from a broader perspective rather than focused on specific individuals. As acknowledged by the authors, similar to the Greentown study, there were limitations to utilising PULSE data to develop the map (Central Statistics Office 2015); (Central Statistics Office 2016). Nevertheless, Garda respondents believed that the map was accurate, giving it an average rating of 8.36 out of 10 for accuracy (p. 48) (O’Meara Daly, *et al.* 2020).

Redtown study

The Redtown study was of a small provincial town. It was ranked third in the Garda subdistricts list because of the number of youths aged under 18 years involved in burglary and drugs for sale and supply. Hence, this location was considered ideal to enable a deep exploration of the factors that may contribute to criminality in this cohort (Naughton, *et al.* 2020).

Findings

The analysis of Garda respondent narratives resulted in two main themes emerging: family influences and drug-related crime. Each will be described separately.

Theme 1: Family influences – adversity, pro-criminal norms, and exclusion

Three young people aged 16 years who were repeatedly involved in burglary offences between 2014 and 2015 along with their engagement with the Redtown criminal network were the focus of Garda narratives. Criminal activity was mainly viewed as normal by their peers and more so by their families who had criminal

histories. The main characteristics of the family were that they were of low status, experienced financial poverty, and had high levels of adversity. In addition, families were rooted within the Redtown criminal network via ‘extended family and drugs-related links’ (Naughton, *et al.* 2020) (p.16). These young people tended to be excluded from the mainstream Redtown community. These factors together influenced young people’s involvement with both criminality and the Redtown criminal network.

Theme 2: Drug-related crime – organised or chaotic

Drug-related offences were the main activity carried out by the Redtown network. How a network member was involved, and the organisational level of the drug-related offence centred on how vulnerable the individual was and their personal drug use (Naughton, *et al.* 2020). (p. 16). Three interconnected groupings were identified:

- Fund personal use (chaotic)
- Carrying and distribution of drugs
- Organised.

‘Organised’ network members mainly carried out ‘higher-level sale and supply’ (p. 16) (Naughton, *et al.* 2020) and remained ‘undetected’ on the network map. While most of the network members could be classified as ‘chaotic’, they carried out lower-level sale and supply of drugs and other crime to pay for drugs for personal use. This group are considered susceptible to exploitation. Figure T4.1.2 provides a summary of the theoretical framework the authors put forward showing the interconnections between themes, subthemes as processes of engagement, and retention of network membership. Further detail on the key network members can be found in section 3.1.1 Part A of the report (p. 17) (Naughton, *et al.* 2020).

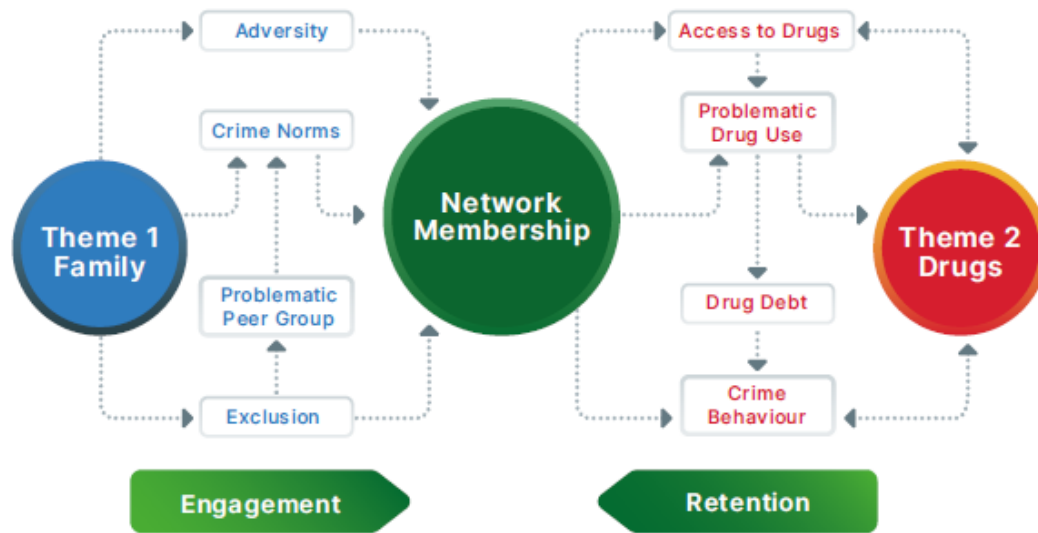

Figure T4.1.2: Network membership theoretical framework for Redtown

Source: Figure 16 extracted from Naughton, Redmond, and O’Meara Daly (2020), p. 40

Strengths and limitations

Several strengths and limitations were identified: for example, due to the level of youth involved in criminality in Redtown, it was viewed as an ‘untapped source’ (p. 41) (Naughton, *et al.* 2020). The Twinsight

method allowed for both group and individual level analysis to be applied. Moreover, this approach allowed for the network to be examined longitudinally, both before and after the 2014–2015 timeframe. Garda respondents were advised that the focus was on young people, which may have influenced their responses. Despite this, the intergenerational nature of offending behaviour was evidenced by the involvement of older family members in the network. More methodological strengths and limitations can be found in all three Greentown Project reports (O'Meara Daly, *et al.* 2020);(Naughton, *et al.* 2020);(Department of Children and Youth Affairs 2016).

Conclusion

The aim of these studies was to explore whether criminal networks influenced children moving into a life of crime. The results are believed to provide hope and opportunities for children drawn into serious and prolific crime. Minister McEntee thanked Dr Sean Redmond and his colleagues for their work and acknowledged the importance of breaking the connection between criminal networks and youth. The Greentown Project has provided the information needed to help prevent youth from becoming part of these networks. She noted that the research evidence shows the seriousness of this issue and requires a 'serious and rapid criminal justice response' (p. 1) (University of Limerick 2021, 27 January).

European Monitoring Centre for Drugs and Drug Addiction

The European Monitoring Centre for Drugs and Drug Addiction (EMCDDA) is a decentralised EU agency based in Lisbon. The EMCDDA provides the EU and its Member States with information on the nature, extent, consequences, and responses to illicit drug use. It supplies the evidence base to support policy formation on drugs and addiction in both the European Union and Member States.

There are 30 National Focal Points that act as monitoring centres for the EMCDDA. These focal points gather and analyse country data according to common data collection standards and tools and supply these data to the EMCDDA. The results of this national monitoring process are supplied to the Centre for analysis, from which it produces the annual *European drug report* and other outputs.

The Irish Focal Point to the EMCDDA is based in the Health Research Board. The focal point writes and submits a series of textual reports, data on the five epidemiological indicators and supply indicators in the form of standard tables and structured questionnaires on response-related issues such as prevention and social reintegration. The focal point is also responsible for implementing Council Decision 2005/387/JHA on the information exchange, risk assessment and control of new psychoactive substances.

Acknowledgements

Completion of the national focal point's reports to the European Monitoring Centre for Drugs and Drug Addiction (EMCDDA) depends on the support and cooperation of a number of Government Departments and statutory bodies. Among those to whom we would like to express our thanks are the staff of the following:

Central Statistics Office

Customs Drugs Law Enforcement, Revenue

Central Treatment List

Department of Children and Youth Affairs

Department of Education and Skills

Drugs Policy Division, Department of Justice and Equality

Drugs Policy and Social Inclusion Unit, Department of Health

Garda National Drugs and Organised Crime Bureau, An Garda Síochána

Forensic Science Ireland

Health Protection Surveillance Centre, Health Service Executive

Hospital In-Patient Enquiry Scheme, Health Service Executive

Irish Prison Service

National Advisory Committee on Drugs and Alcohol, Department of Health

National Social Inclusion Office, Primary Care Division, Health Service Executive

We also wish to acknowledge the assistance of the coordinators and staff of local and regional Drug and Alcohol Task Forces, and of voluntary, community-based, and other non-governmental organisations.

We wish to thank our HRB colleagues in the Evidence Centre, National Drug Treatment Reporting System, the National Drug-related Deaths Index and the HRB National Drugs Library, all of whom made significant contributions to the preparation of this National Report.
